ACCESSORIES

For a complete list of accessories and details of their compatibility, refer to the Catalogue.

Dear heating engineer,

We would like to congratulate you on having recommended a solar controller **EVOSOL** unit: a modern product that is capable of ensuring a high degree of reliability, efficiency, quality and safety.

While your technical skills and knowledge will certainly be more than sufficient, this booklet contains all the information that we have deemed necessary for the device's correct and easy installation.

Thank you again, and keep up the good work,

CONFORMITY

EVOSOL solar controllers conform to:

- EN 61000-6-1:2007
- EN 61000-6-3:2007/A1:2011
- EN 61000-3-2:2014
- EN 61000-3-3:2013
- EN 60335-1:2012
- Electromagnetic Compatibility Directive 2014/30/EU
- Low Voltage Directive 2014/35/EU
- Machinery Directive 2006/42/EC
- Directive 93/42/EEC concerning medical devices
- Directive 2011/65/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

At the end of its life, the product should be not be disposed of as solid urban waste, but rather it should be handed over to a differentiated waste collection centre.

The following symbols are used in this manual:

A **CAUTION!** = Identifies actions that require caution and adequate preparation.

E **STOP!** = Identifies actions that you MUST NOT do.

1 GENERAL INFORMATION

1.1 General Safety Information

! After having removed the package, be sure to verify the integrity and the completeness of the consignment, and contact the Agency from which the device was purchased if any discrepancies are encountered.

! The product's installation must be carried out by an authorised company that will issue a declaration of the installation's conformity to the product's owner once the work has been completed, indicating that the work has been carried out in accordance with the standards of good practice, the current National and Local regulations, and the indications provided by the manufacturer in the instruction booklet accompanying the device.

! The product must be used for its intended purpose (as described by the manufacturer) for which it has been expressly manufactured. The manufacturer shall bear no responsibility, whether of a contractual or non-contractual nature, for any damage caused to people, animals, or property due to incorrect installation, adjustments, or maintenance, or improper use.

! This booklet is an integral part of the device, and must therefore be carefully preserved, and must ALWAYS accompany the solar controller, even in the event that it is sold to another Owner or User, or is transferred to another system. If it is damaged or lost, another copy can be requested to Technical Assistance Service in your Area.

1.2 Precautions

- Never clean the boiler without first disconnecting it from the mains electricity supply by turning the mains power switch and the control panel switch OFF.

- Do not tamper with or adjust the safety or control devices without prior authorisation and instructions from the manufacturer.

- Never pull, disconnect, or twist the electrical cables coming from the appliance even if it is disconnected from the mains electricity supply.

- All maintenance and repairs must be carried out by a legally qualified heating engineer.

- Do not use water to extinguish fire in the control panel. Switch power OFF at the mains power switch to isolate the control panel electrically first. Then use a class E fire extinguisher (marked "SUITABLE FOR LIVE ELECTRICAL ITEMS") to extinguish the flames.

- Do not dispose of packaging material into the environment, or leave it within the reach of children, since it can become a potential hazard. Dispose of packaging material in compliance with applicable legislation.

- Do not allow children or infirm persons to operate the system unsupervised.

- It is forbidden to touch the device while barefoot or with wet or moist body parts.

- It is forbidden to commission the equipment, even temporarily, with safety devices that are not working or have been tampered with.

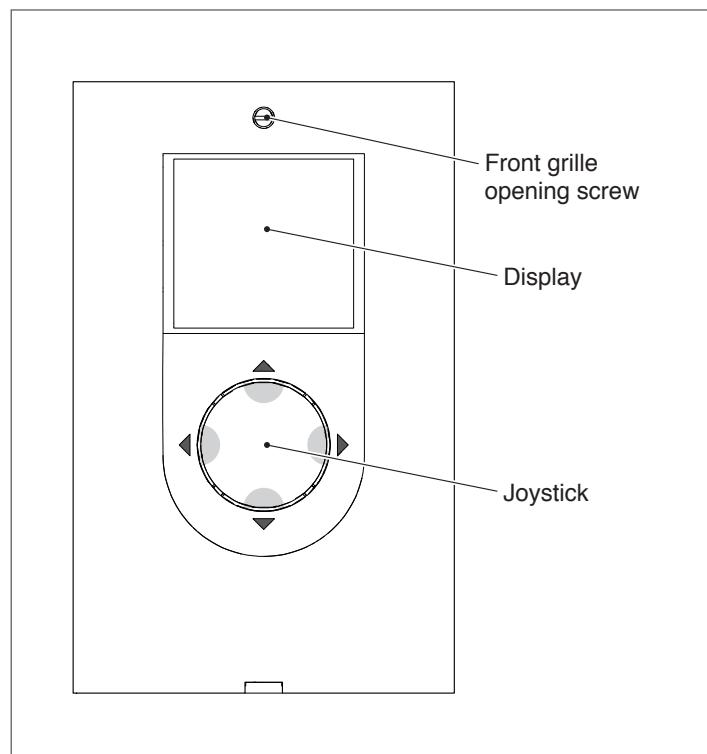

1.3 Description of the appliance

The solar regulator **EVOSOL** is suitable for regulating a solar integration system: it controls the heat transfer from the solar collectors to a storage system. It is responsible for the operation of the pump using the information collected from temperature probes. It can also control the integration.

The solar regulator provides 9 system layouts and advanced functions, such as adjustment of pump speed, thermal disinfection function, protection of solar collectors against overtemperature and too low temperatures (anti-freeze function), and operating hours counter.

The solar regulator is provided with 4 inputs for temperature probes, 2 NTC 10K @ 25°C (ß 3435) to be installed in storage system 1, and 2 PT1000 to be installed in the solar collectors or in the second storage system, 1 static control output for pumps or standard 230 VAC 3-way valves, 1 Volt-free dry contact and 2 PWM outputs for modulating pumps.

1.4 System layout

1.5 Technical specifications

Description	EVOSOL	
Power supply		230Vac +10 -15% 50-60Hz
Protection (fuse)		F 3.15A – 250V – 5x20mm – rapid
Maximum consumption in stand-by		3W
Maximum allowed overall consumption		600W
Level of protection from external agents		IP20
Outputs	U1	1 static output 230Vac 1.3A Max @ $\cos \varphi > 0.5$
	U2	1 Volt-free dry contact output (230Vac 1A Max)
Control outputs	CN6	2 PWM static outputs at 24VDC 25mA Max
Temperature sensors	S1-S4(S6)	PT1000 class B
	S2-S3	NTC 10K @ 25°C (β 3435)
Conversion accuracy		±2°C
Interconnection with other control units		RS-485 line (Modbus RTU protocol)
Maximum number of interconnected devices		32
Maximum interconnection length (node sum)		500 m twisted pair shielded cable AWG 22-24 @ 9600 Baud transmission speed
Start and end termination of control unit interconnection		through jumper position J4
Net weight		300g

2 INSTALLATION

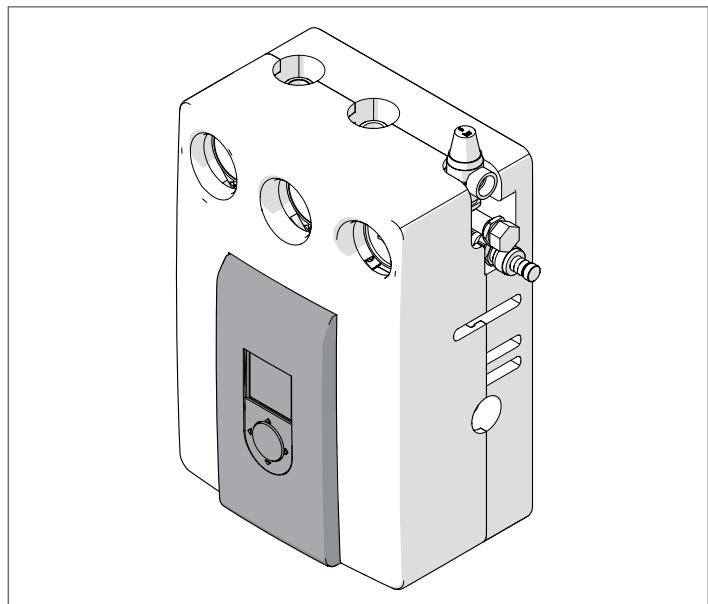

2.1 Installation on products

! For information on the receipt of the solar regulator purchased as already integrated in a different product (for example, heater or solar station), refer to the indications outlined in the booklets provided with the product.

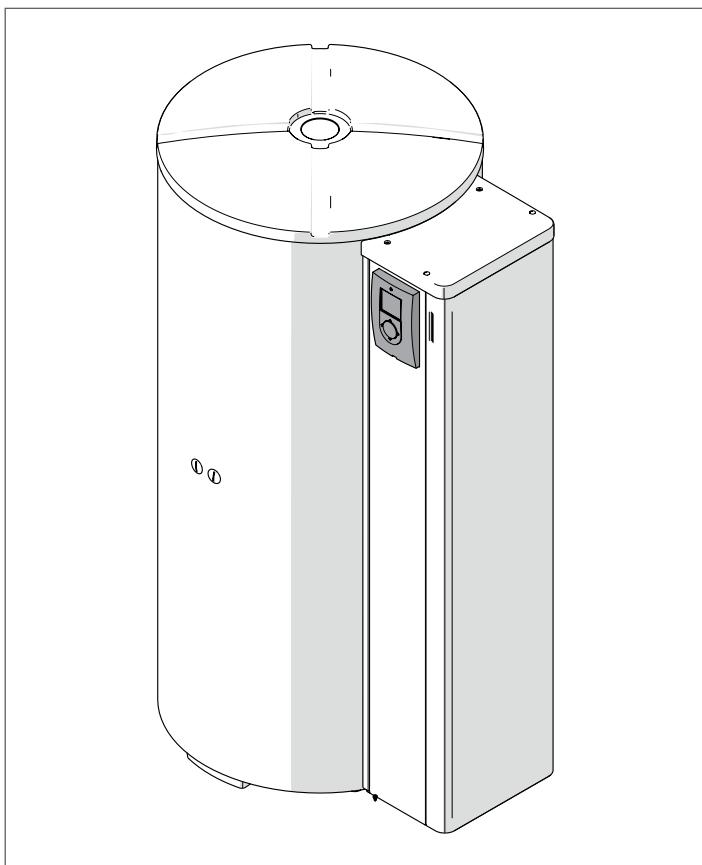

The regulator is already mounted as standard on the following products:

- solar station
- boiler with compact solar station
- boiler with column-solar station.

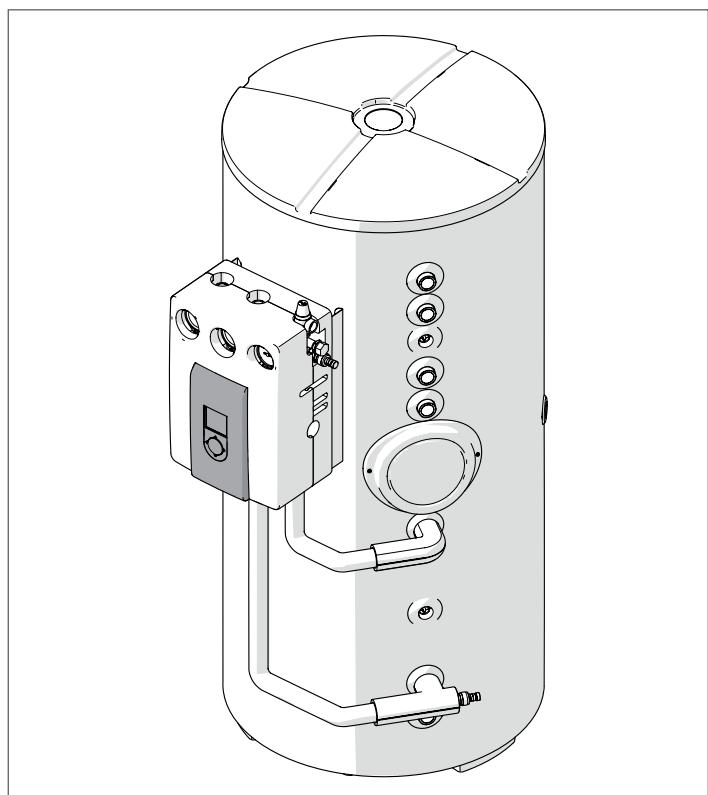

Solar station

Boiler with column-solar station

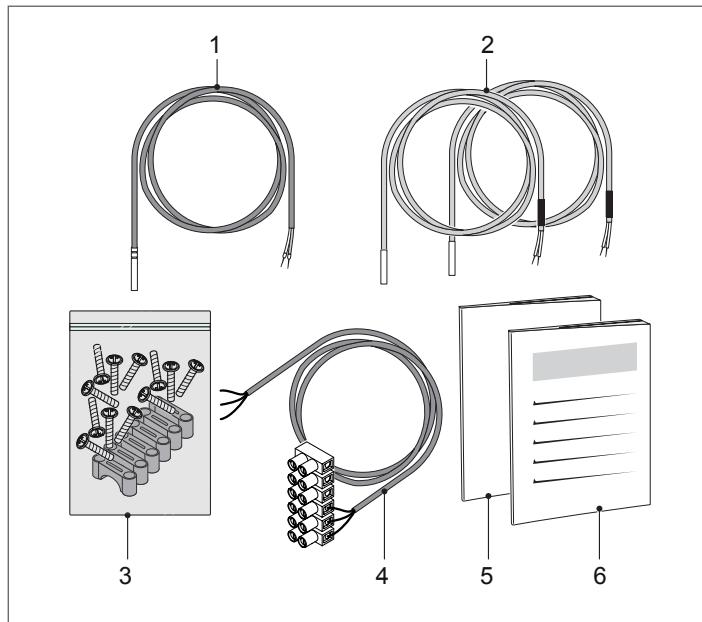

Boiler with compact solar station

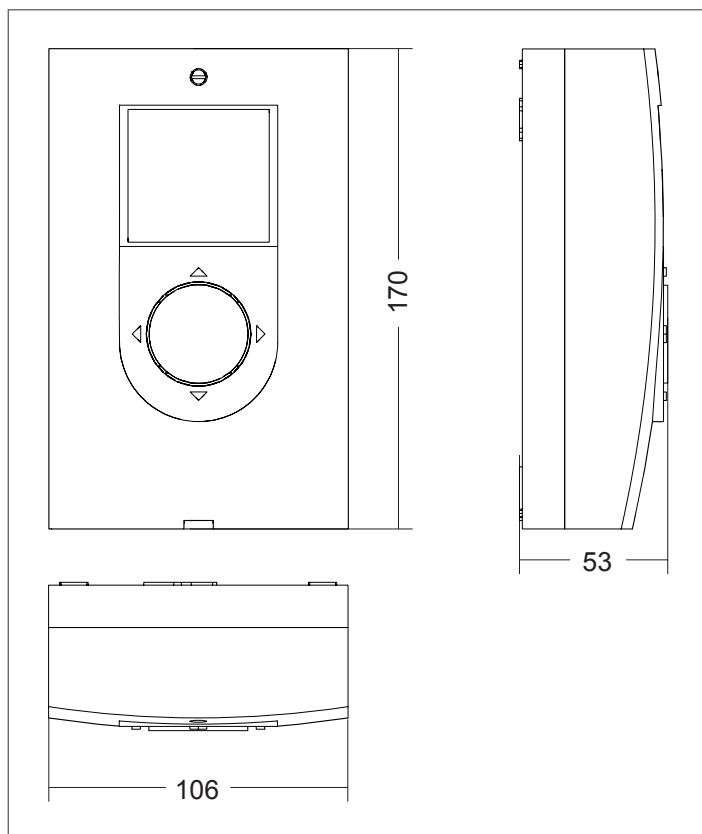

2.2 Unpacking the product (only for separately purchased version)

The controller **EVOSOL** is supplied packed in a carton box together with the following accessories:

- 1 1 probe PT1000
- 2 2 probes NTC 10K @ 25°C (B 3435)
- 3 1x accessories bag containing:
6 cable glands with fastening screws
- 4 wiring for PWM signal connection
- 5 Installer booklet
- 6 User booklet.

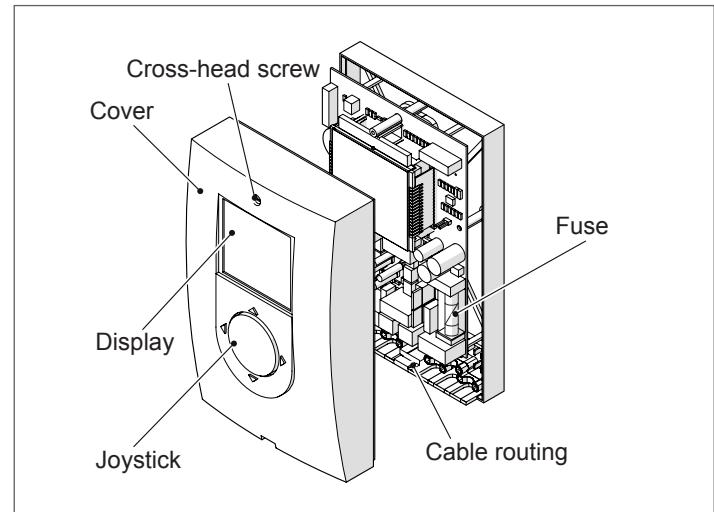

2.3 Dimensions

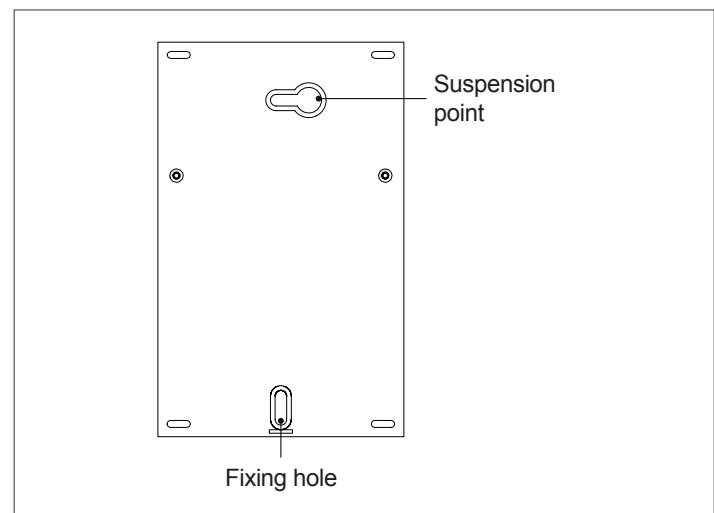

2.4 Assembly (only for separately purchased version)

To assemble the regulator:

- Unscrew the cross screw and remove the front controller grille

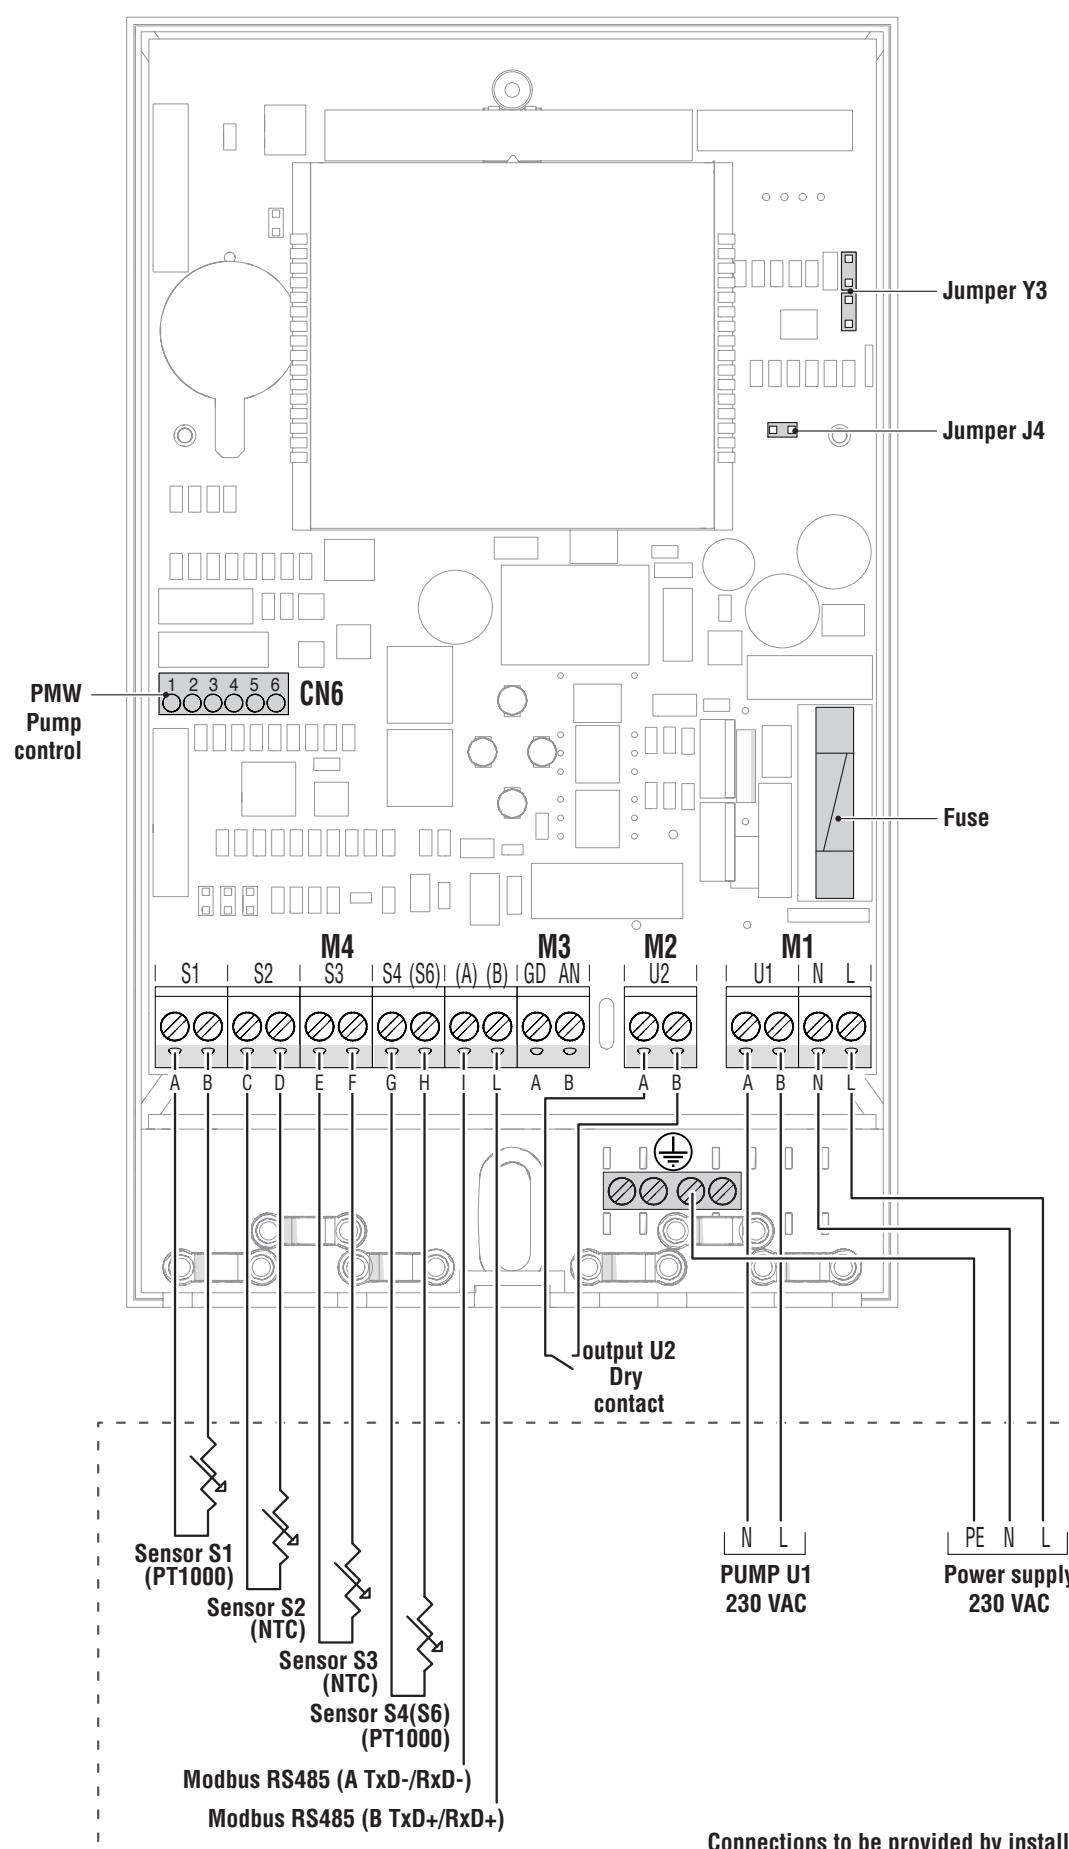

- Mark the upper fastening point on the mounting bracket or on the wall, drill and pre-install the block with the screw

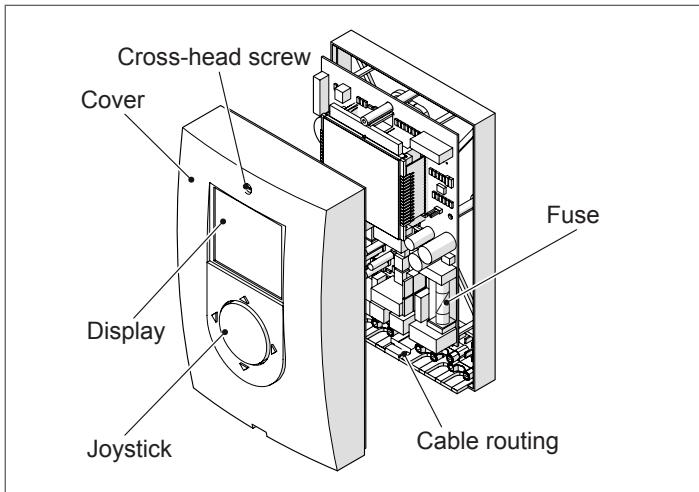

- Fit the controller casing over the top fixing point and mark the position of the bottom fixing hole (distance between holes 130 mm)
- Drill the hole and fit the bottom wall plug
- Hitch the device to the upper fastening point and fasten it to the lower block
- Make electrical connections respecting the terminal nomenclature according to the instructions in the following paragraph
- Remove the protective film from the display
- Fit the grille and fasten it to the case with the cross screw.

2.5 Wiring diagram

2.6 Electrical connections

- !** Before opening the solar regulator, make sure that the mains voltage is completely cut off.
- Unscrew the cross screw and remove the front solar regulator grille

- Route the cables through the fairleads and fasten them using the cable glands supplied.
- When electrical connections are ready, fasten the front grille.

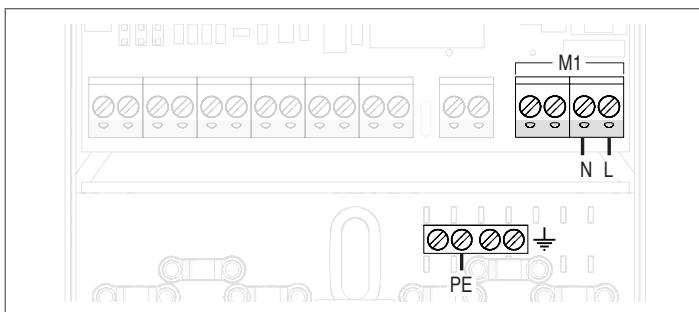

2.6.1 Controller power connections

The solar regulator power supply must have a voltage of: 230V and 50–60Hz.

Prepare a power supply disconnecting switch for maintenance purposes.

Terminal block M1 connections:

L Live
N Neutral
PE Earth/ground

2.6.2 Inputs for temperature sensors

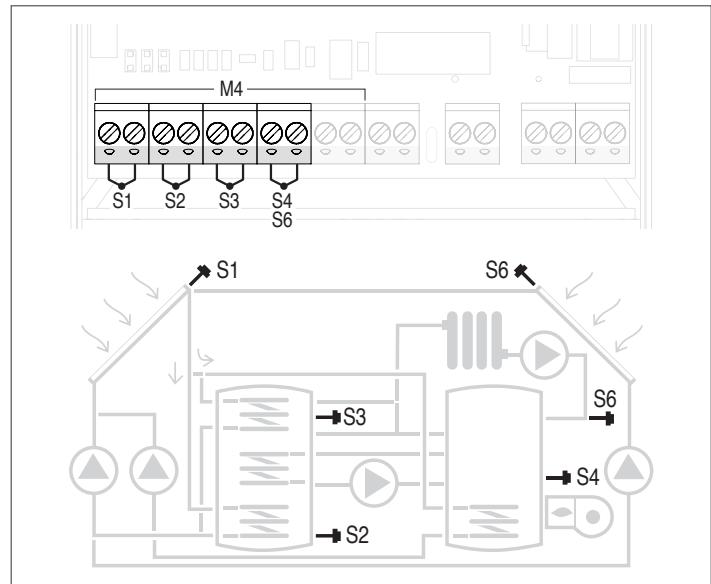

The solar regulator is equipped with 4 inputs for temperature probes to be connected according to the system layout chosen. Cable polarity is not important.

Upon connection, or should it be necessary to increase probe cable length, refer to these remarks:

- Absolutely avoid laying probe cable together with mains power cables and/or AC cables
- Absolutely avoid routing cables close to strong magnetic fields
- Avoid any cable jointing as much as possible; solder and duly insulate any indispensable jointing
- Use twisted and shielded wires
- Use cables having a cross-section of over 0.5 mm²

Terminal block M4 connections:

- Probe S1 PT1000 (collector 1 temperature probe)
- Probe S2 NTC (accumulation tank 1 lower temperature probe)
- Probe S3 NTC (accumulation tank 1 upper temperature probe)
- Probe S4 PT1000 (accumulation tank 2 temperature probe) or probe S6 PT1000 (collector 2 temperature probe; heating system return temperature probe).

When temperature probes are connected they can be tested with a multimeter. The correspondence between temperature and resistance is shown in the following tables.

Resistance values for Pt1000 sensors			
°C	Ω	°C	Ω
-10	961	55	1213
-5	980	60	1235
0	1000	65	1252
5	1019	70	1271
10	1039	75	1290
15	1058	80	1309

27	9283	55	3544	83	1534		

2.6.3 U1-U2 outputs

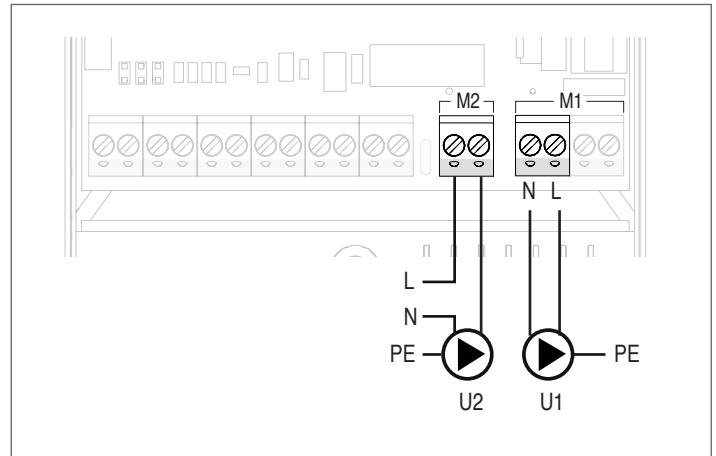

The solar regulator is equipped with 2 independent outputs for standard or modulating pump. On the U2 output it is possible to manage a 3-way valve based on the chosen system layout.

STANDARD PUMP CONNECTION

Terminal block M1 connections: output U1 (230Vac)

- Pump 1 neutral (N)
 - Pump 1 phase (L)

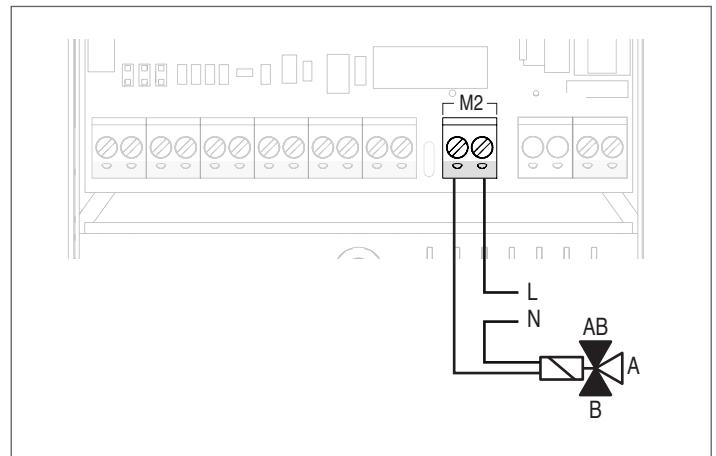

Terminal block M2 connections: output U2 (Volt-free dry contact)

CONNECTION FOR 3-WAY VALVE

Terminal block M2 connections: output U2 (Volt-free dry contact)

- AB-B valve ON
 - AB-A valve OFF

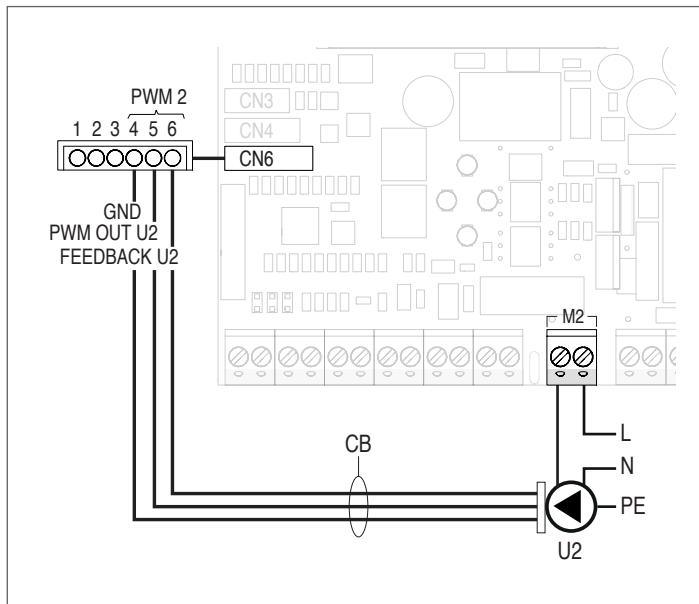

! The regulator only manages non-modulating on-off valves. The connection to the CN6 connector must not be used.

CONNECTION TO PWM MODULATING PUMPS

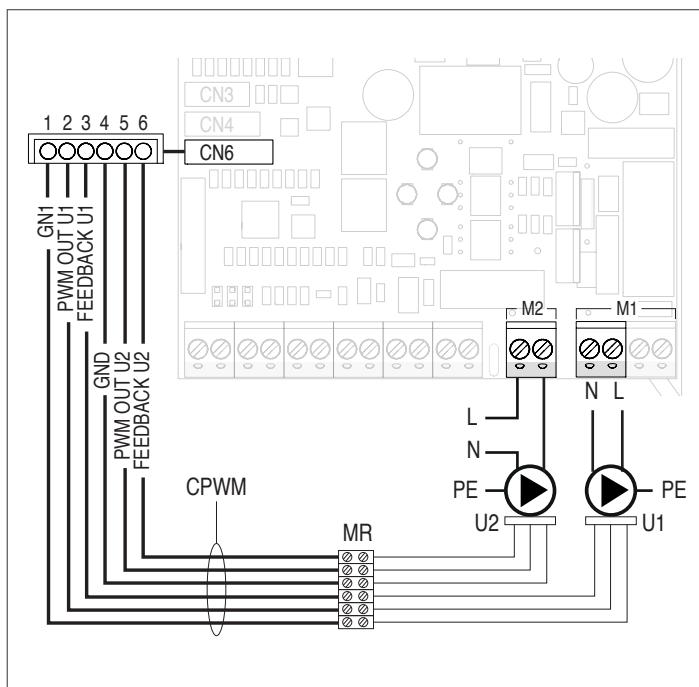

REGULATOR ADDED TO ANOTHER PRODUCT

The solar regulator already added to another product can handle a further modulating pump (as an alternative to the standard 230Vac pump) connecting the pump control to connector CN6 using the wiring (CB) available as an accessory. The power part must be connected to terminal board M2 (output U2).

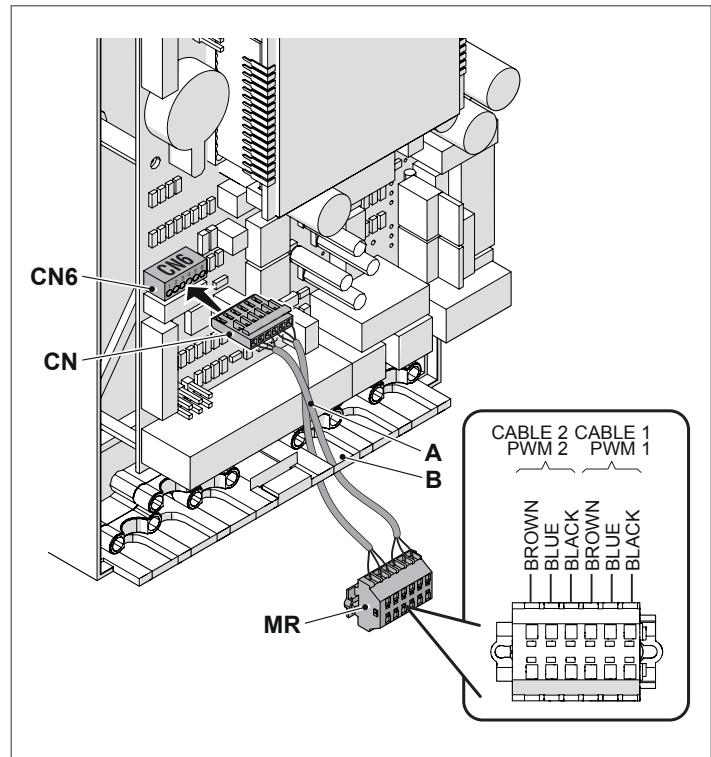

REGULATOR PURCHASED SEPARATELY

The solar regulator purchased separately is able to handle 2 modulating pumps (as an alternative to standard 230Vac pumps) by connecting the pump control to the CN6 connector using the "WIRING FOR PWM SIGNAL CONNECTION" (WPWM) supplied. The power part must be connected to terminal board M1 (output U1) and M2 (output U2).

For the installation of the "WIRING FOR PWM SIGNAL CONNECTION" operate as described below.

- Insert the connector (CN) in the connector (CN6) on the regulator board
- Thread the wiring (A) from the regulator through the passages (B)
- Connect the wiring to the feedback terminal board (MR) as shown in the diagram below

- Connect the PWM controls of the pumps to the feedback terminal board (MR).

! The feedback terminal board (MR) should be positioned in an appropriate electrical cabinet or in any case in a suitably prepared and protected place.

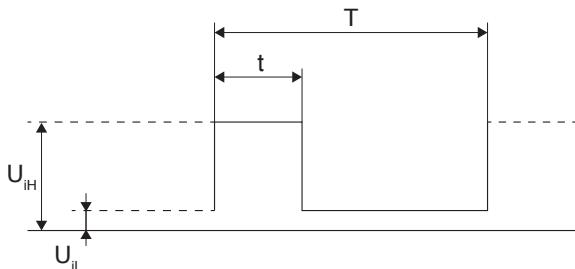

2.6.4 PWM control signals

The pump must be controlled via a PWM (pulse width modulation) low-voltage digital signal. The speed changes according to the input signal, as indicated in paragraph "PWM input signal". Here below are the main characteristics required of the PWM signal.

! Check the characteristics of your pump PWM signal to ensure they comply with the features below. Different signals could irreversibly damage the pump on-board electronics.

PWM low-voltage digital signal

The PWM square wave signal was designed for a frequency interval between 100 and 4000 Hz. The PWM signal is used to set pump speed.

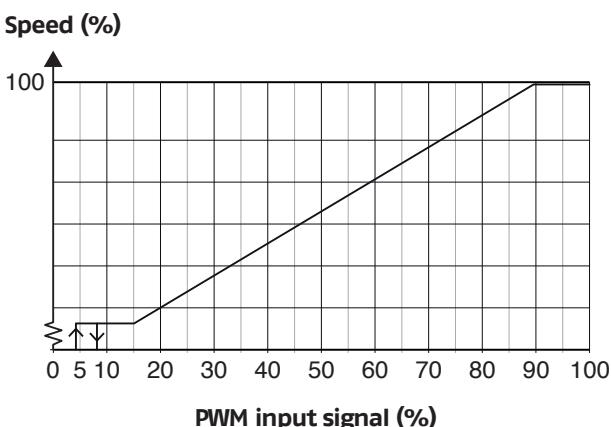

Example of Duty cycle

T	Period
d	Duty cycle (t/T)
UiH	High voltage level of input signal
UiL	Low voltage level of input signal
iiH	Input signal current

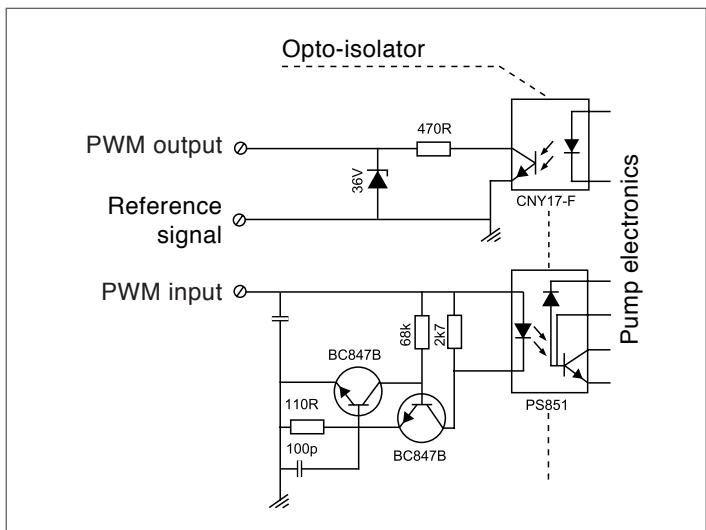

Example	Evaluation
$T = 2 \text{ ms (500 Hz)}$	$UiH = 4-24 \text{ V}$
$t = 0,6 \text{ ms}$	$UiL \leq 1 \text{ V}$
$d \% = 100 \times 0.6 / 2 = 30 \%$	$iiH \leq 10 \text{ mA (depending on } UiH)$

PWM input signal

With a low input value (<5 % PWM), the pump cannot start. The pump stops when input signal is 5 to 8% of PWM signal or when PWM signal is not present, for safety reasons. If the pump receives no input, due for instance to failure of the signal cable, it will stop in order to avoid solar system overheating.

! Verify that the control logic of your pump is directly proportional (as indicated in the chart) and not inversely proportional.

Electronic circuit**Technical specifications**

Maximum power	Symbol	Value
PWM input frequency	f	100-4000 Hz
Consumption in stand-by		< 1 W
High voltage level of input signal	UiH	4-24 V
Low voltage level of input signal	UiL	< 1 V
Input signal current	iiH	< 10 mA
Input Duty cycle	PWM	0-100%

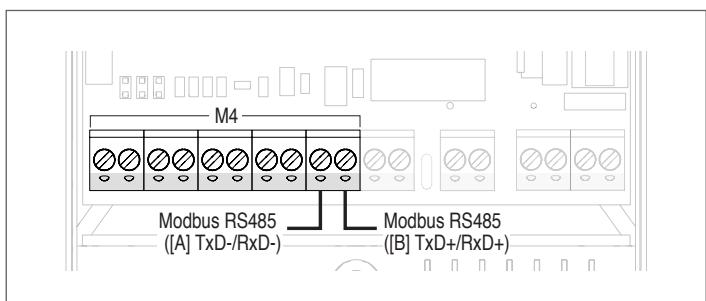

2.6.5 Modbus data transmission

The solar regulator is equipped with 1 terminal for data transmission and reception through MODBUS RTU protocol on RS-485 line.

! Pay attention to polarity of terminals A and B.

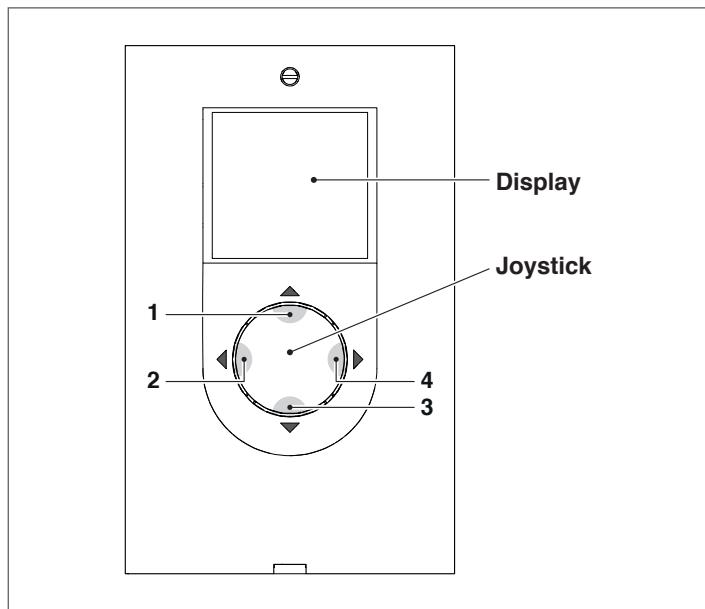

Terminal block M4 connections:

- MODBUS RS485 ([A] TxD-/RxD-)
- MODBUS RS485 ([B] TxD+/RxD+)

2.7 User interface

The solar controller is controlled through the joystick with 4 keys.

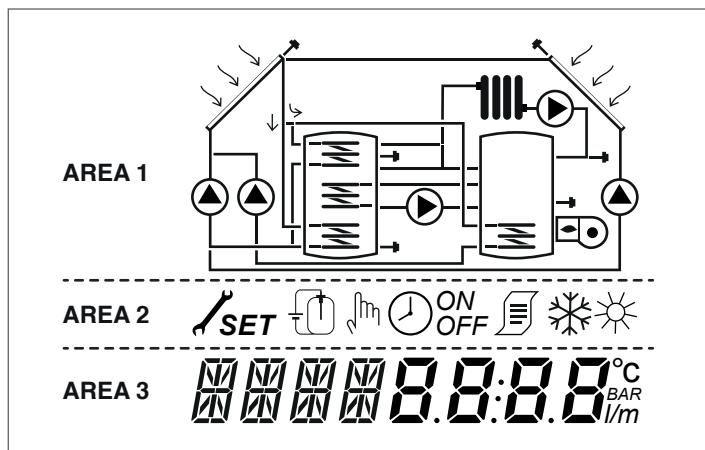

- Press "◀" (2) for a few seconds to enter the password to access parameters intended for the Installer.
- Press "◀" (2) or "▶" (4) to scroll adjustment/display parameters; during a parameter change, press for a few seconds to confirm the value set and go back to the list of parameters.
- Press "▲" (1) for a few seconds to make the parameter displayed editable and increase its value.
- Press "▼" (3) to decrease the value of the selected parameter.
- Press "▼" (3) for a few seconds to edit time, day and display language.

2.7.1 Nr. displayed

The solar controller is provided with a backlit 2.8" LCD. The display can be divided into 3 areas:

- 1 System layout area**
- 2 Symbol area**
- 3 Parameter area**

1 System layout area

The system layout area shows the active layout stored through parameter SYSN. The symbols displayed flash, remain steady or disappear according to the current system status.

2 Symbol area

The symbol area indicates the system status.

3 Parameter area

In the lower display area it is possible to display solar controller parameters; the left area displays the parameter code, whereas the right area displays the value with the relevant unit of measurement or setting of the parameter.

During stand-by the display is turned off with an indication of the temperature of the upper part of the storage (S3). Press any button to view the display.

2.7.2 Display icons

	Solar Collector
	Pump The symbol flashes during operation
	Accumulation tank
	Supplementary system The symbol flashes during operation
	Radiator/heating system
	Accumulation tank coil
	Temperature probe The symbol flashes when the relevant display parameter is selected
	Alarm presence (maintenance request)
	Anti-freeze symbol
	Panel overtemperature
SET	Parameter programming When the parameter displayed can be edited, the steady SET writing is displayed, when accessing edit mode, the writing starts flashing until confirmation
	"Automatic" schedule
	Manual mode (it enables the forced management of the outputs U1/U2)
	Energy calculation (not used)
	These symbols start flashing when the thermal disinfection function (anti-legionella) is enabled

2.8 Menu structure

The solar regulator menu has a circular structure and does not contain any submenus. Press "►" to scroll cyclically all the parameters present according to the associated system layout. Once the last parameter is reached, press "►" to go back to the first one.

Instead, by pressing "◀" it is possible to scroll through the parameters in the opposite direction, but the display stops once it reaches the first parameter (any empty positions are not displayed, for example in layout 1 after parameter 9 the menu skips to parameter 41).

Installer parameters can be accessed only after having entered the security password (see chapter "Enter Password").

Key:

x	Parameter available in the relevant system diagram
U	Parameters displayed by the User
I	Parameters displayed by the Installer
VIS	Read-only parameter
SET	Settable parameter

3 PARAMETER DESCRIPTION

3.1 Probe temperature display

S1-S2-S3-S4-S6 (par. no.: 0-1-2-3-5)

Indicates the temperature detected by the probe concerned (display only).

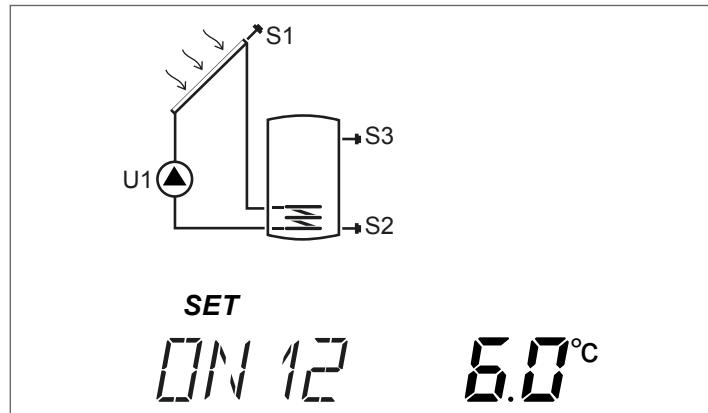

Only the probes concerning the system chosen are displayed.

3.2 ΔT settings

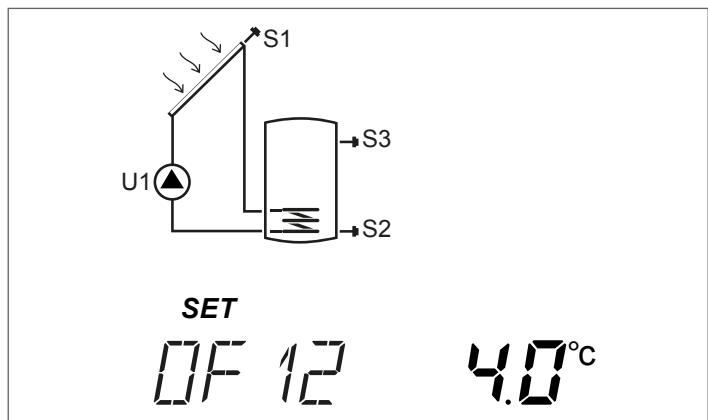

ON12-ON13-ON14-ON62-ON34-ON36-ON43 (par. no.: 8-10-12-14-16-18-24)

These parameters allow setting the required temperature difference between the indicated probes to activate the pump or switch the three-way valve, according to the system layout selected (for example, "ON12" refers to the temperature difference between probe S1 and probe S2).

OF12-OF12-OF13-OF14-OF62-OF34-OF36-OF43 (par. no.: 9-11-13-15-17-19-25)

These parameters allow setting the required temperature difference between the indicated probes to deactivate the pump or switch the three-way valve, according to the system layout selected (for example, "OF12" refers to the temperature difference between probe S1 and probe S2).

3.3 Manual mode U1-U2

MAN1-MAN2 (par. no.: 41-44)

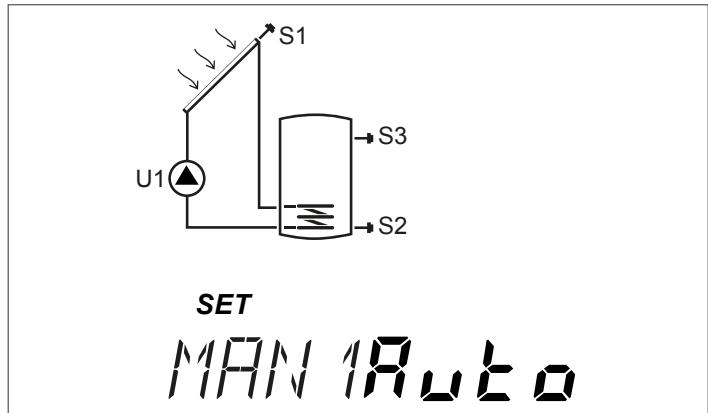

These parameters allow forcing the status of the outputs U1 and U2, to which the solar collector pump and the second pump or 3-way valve are connected.

Settable parameters are:

OFF Output always disabled

ON Output always enabled

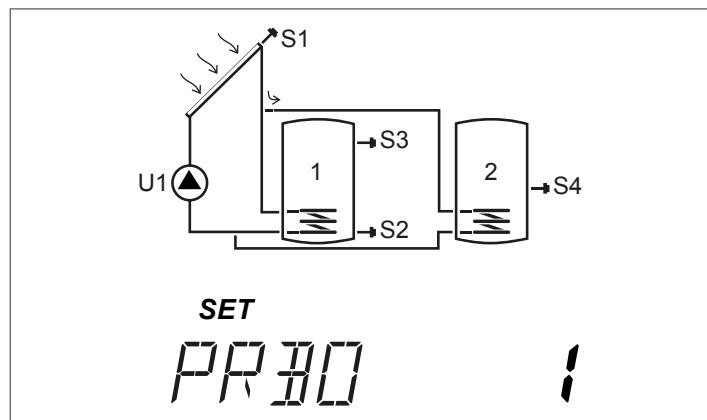

AUTO Output mode based on solar regulator programming

3.4 Accumulation tank priority

PRB0 (par. no.: 53)

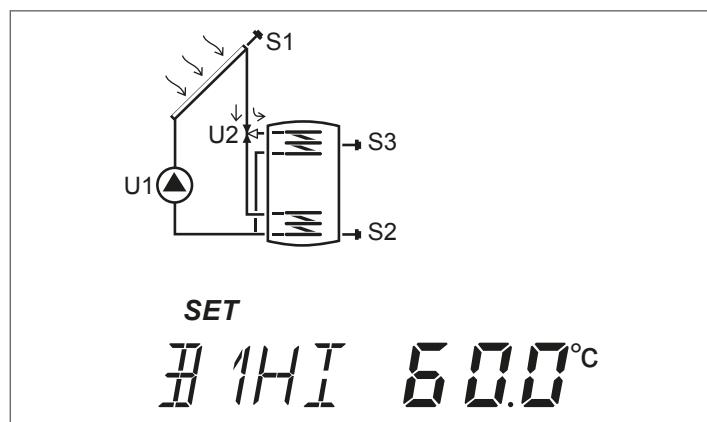

In system layouts where several accumulation tanks are present, it is possible to select the accumulation tank having heating priority.

3.5 Accumulation tank 1 high part setpoint

B1HI (par. no.: 56)

With this parameter, it is possible to set the water temperature setpoint for the high zone of storage system 1. The temperature is detected by probe S3.

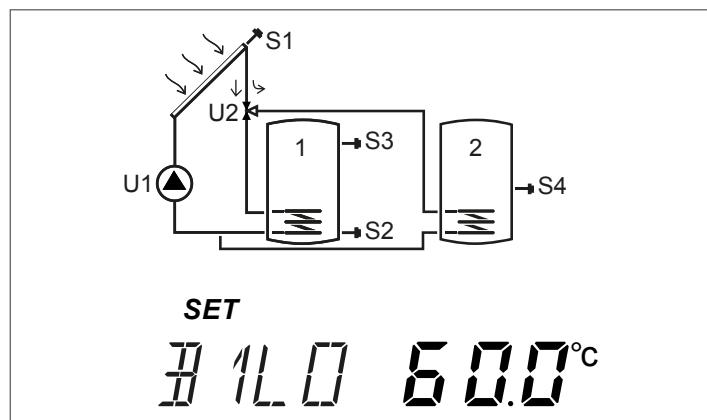

3.6 Accumulation tanks 1 and 2 low part setpoint

B1LO-B2LO (par. no.: 59–64)

With these parameters, it is possible to set the water temperature setpoint for the low zone of storage systems 1 and 2. The temperature is detected by probes:

S2 for accumulation tank 1

S4 for accumulation tank 2

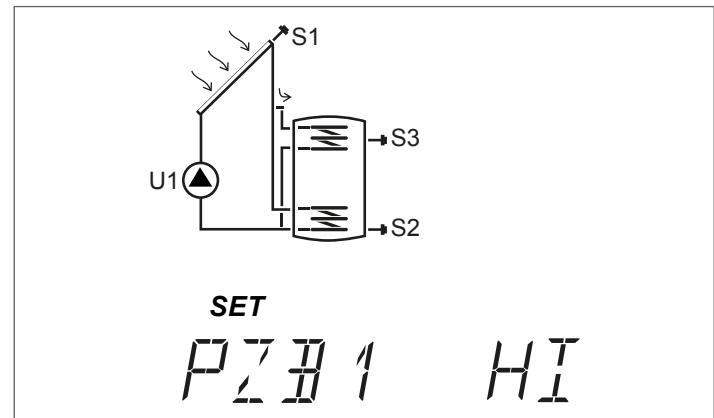

3.7 Accumulation tank 1 zone priority

PZB1 (par. no.: 67)

In system layouts with double heating zone of an storage system, it is possible to set a heating priority.

HI High zone priority

Lo Low zone priority

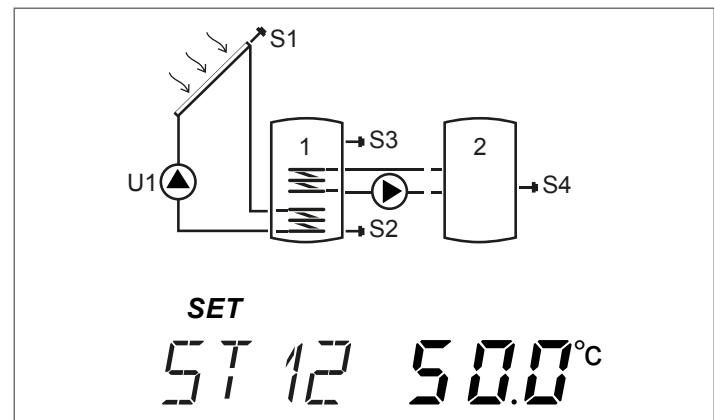

3.8 Heat transfer activation threshold between accumulation tank 1 and 2

ST12 (par. no.: 73)

With this parameter it is possible to set the temperature at which heat exchange between accumulation tank 1 and accumulation tank 2 can be activated.

The reference temperature is detected by probe S3 through the differential between the temperatures detected by probes S3 and S4.

3.9 Threshold for collector 1 and 2 solar pump start

PS10-PS20 (par. no.: 76-79)

With these parameters, it is possible to set the minimum temperature of the solar collector to activate pumps.

SET
PS 10 30.0 °C

The reference temperature is detected by probes:

S1 for solar collector 1
S6 for solar collector 2

3.10 System selection

SYSN (par. no.: 82)

With this parameter it is possible to select the preset system layout.

9 system layouts are available; while user scrolls the systems in the list, the corresponding basic hydraulic diagram is displayed. Every system layout has some specific presets that can be modified individually.

SET
SYSN 1

3.11 Supplement activation threshold

SAB1 (par. no.: 91)

With this parameter it is possible to set the temperature of storage 1, detected by probe S3, under which the supplementary system turns on if it is in the time schedule set.

SET OFF
SAB1 1 40.0 °C

3.12 Supplement deactivation threshold

SSB1 (par. no.: 94)

With this parameter it is possible to set the storage temperature, detected by probe S3, at which the supplementary system can be turned off.

SET ON
SSB1 1 45.0 °C

3.13 Weekly schedule

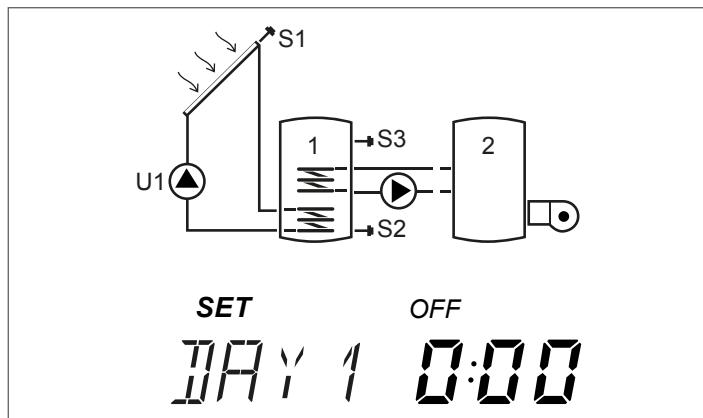

DAY1-DAY2-DAY3-DAY4-DAY5-DAY6-DAY7 (par. no.: 103-104-105-106-107-108-109)

With these parameters, it is possible to set the activation time intervals of the burner or thermal integration system for every day of the week and at intervals of 30 minutes in a 24 hour frame.

Within the intervals set, if the temperature detected by probe S3 is lower than the value set in parameter "SUPPLEMENT ACTIVATION THRESHOLD (par. no. 91)", the burner or thermal integration system is activated and remains operational until the temperature set in parameter "BURNER 1 DEACTIVATION THRESHOLD (par. no. 94)" is reached.

The number x that follows the parameter (DAYx) indicates the day of the week:

- 1 Monday
- 7 Sunday

Press "▲" or "▼" to scroll the 24 hours of the specified day and view the settings. "ON" and "OFF" icons indicate the status of the burner or thermal integration system in the relevant half hour:

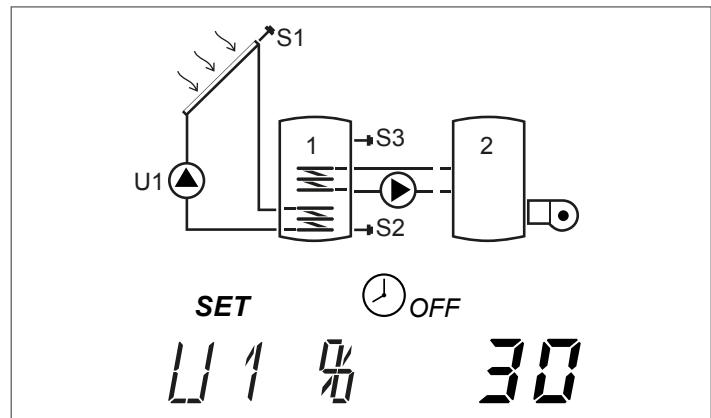

Example:

- If 0:00 and OFF appear, in the half hour from 12:00 a.m. to 12:30 a.m. the burner or thermal integration system is off even if activation conditions are met
- If 0:00 and ON appear, in the half hour from 12:00 a.m. to 12:30 a.m. the burner or thermal integration system is on even if activation conditions are met

3.14 Solar pump 1 current speed

U1%- U2% (par. no.: 112-115)

With these parameters it is possible to display the percentage speed of pumps connected to outputs U1 and U2, respectively. This function is suitable for solar pumps with PWM control.

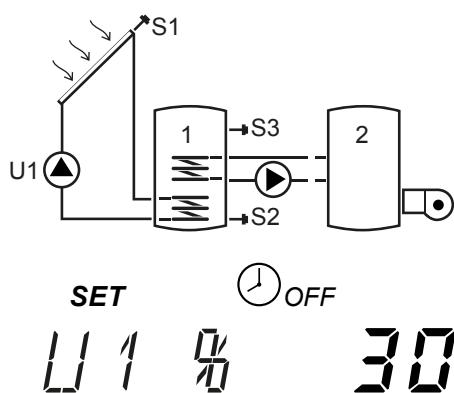

NOTE: With NON modulating pumps, "100" is displayed when the pump is stopped and "0" when the pump is operating.

3.15 Minimum speed of solar pump 1 and pump 2

U1%-U2% (par. no.: 124-127)

With these parameters it is possible to set the minimum speed of pumps connected to outputs U1 and U2, respectively.

3.16 U1-U2 output control mode

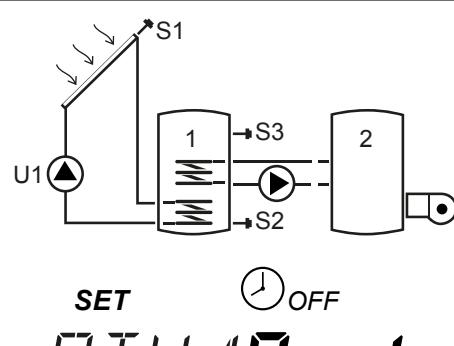

PIU1-PIU2 (par. no.: 136-139)

With these parameters it is possible to set the control mode of pumps connected to output U1 and U2.

ON-OFF Control mode of standard 230 Vac pumps

IMPU It allows modulating the speed of standard 230 Vac pumps at cut-off based on ΔT between collector and storage system temperatures as defined by parameter SOU1-SOU2 (par. no. 148-151).

MODU PWM control mode of modulating pumps allows modulating speed through pump on-board electronics, based on ΔT between collector and storage system temperatures as defined by parameter SOU1-SOU2 (par. no. 148-151).

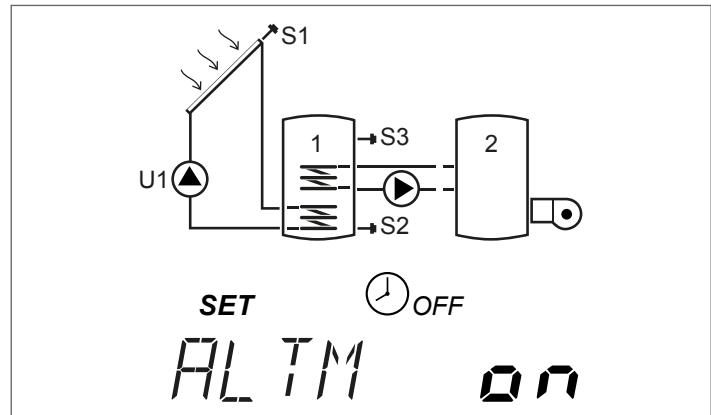

3.17 Pump modulation

ALTM (par. no.: 147)

This parameter allows setting the regulation type of modulating pumps to maintain the setpoint set in parameter "U1-U2 MODULATION DIFFERENTIAL SET (par. no. 148-151)":

OFF P modulation. By setting this modulation type, the pump speed is regulated only proportionally (linear). The rotation speed range is from 100% to xx% "MINIMUM SPEED U1" (par. no. 124-127).

PID PID modulation. By setting this modulation type, the pump speed is regulated with a PID function (Proportional-Integral-Derivative regulation type). The speed modulation range is from 100% to xx% "MINIMUM SPEED U1" (par. no. 124-127).

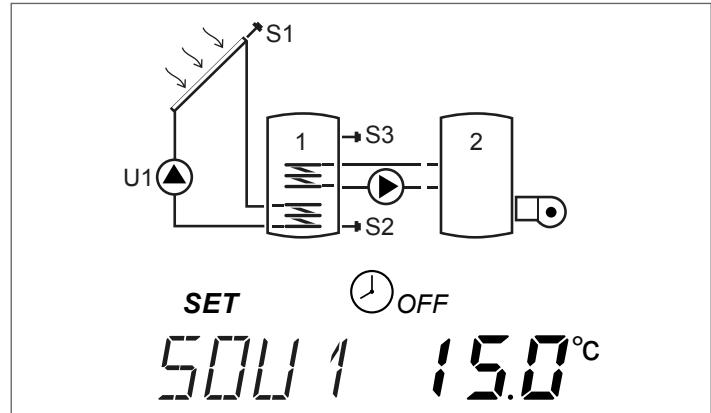

3.18 U1-U2 output modulation differential set

SOU1-SOU2 (par. no.: 148-151)

These parameters allow setting the temperature differential required to activate pump modulation set via parameter "PUMP MODULATION" (par. no.: 147).

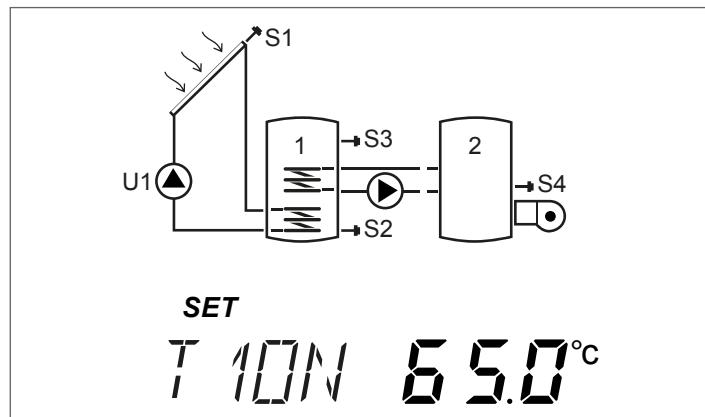

SOU1 (measured from difference between S1-S2) affects the pump connected to output U1; SOU2 affects the pump connected to output U2 and is linked to its activation differential, which is not always the same and depends on the applied layout type (for example, in layout 2 it is measured between S3-S4).

3.19 Output u2 activation temperature for solid fuel generator supplementary system

T10N (par. no.: 160)

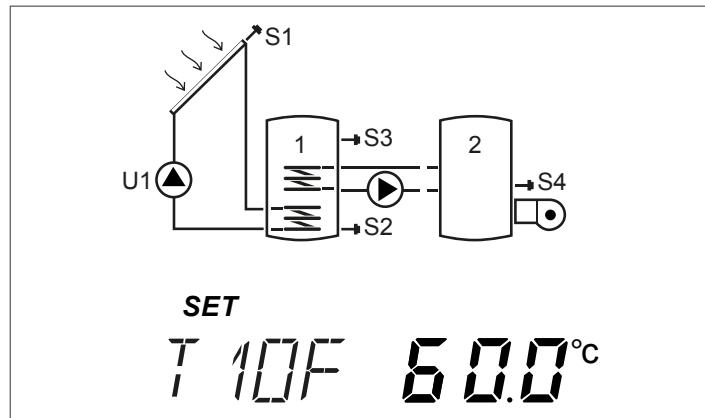

With this parameter it is possible to set the minimum temperature, detected by probe S4, to start heat exchange between solid fuel generator and accumulation tank.

3.20 Output u2 deactivation temperature for solid fuel generator supplementary system

T10F (par. no.: 163)

With this parameter it is possible to set the temperature, detected by probe S4, to stop heat exchange between solid fuel generator and accumulation tank.

3.21 Anti-stagnation function (overtemperature dispersion) collector 1 and 2

OSP1-OSP2 – OPP1-OPP2 (par. no.: 166-172-169-175)

Parameters OSP1 and OSP2 allow to set the temperature to activate ANTI-STAGNATION FUNCTION of collectors 1 and 2.

If probes S1, S6 detect a temperature equal to the value set, in parameters OSP1 and OSP2 respectively, the function that avoids the frequent stagnation in solar panels activates, to avoid their overheating.

The function activation is signalled by icon flashing at 1 second frequency.

The function is disabled when the temperature set in parameters OPP1 and OPP2 is reached

The anti-stagnation function is set through the following parameters:

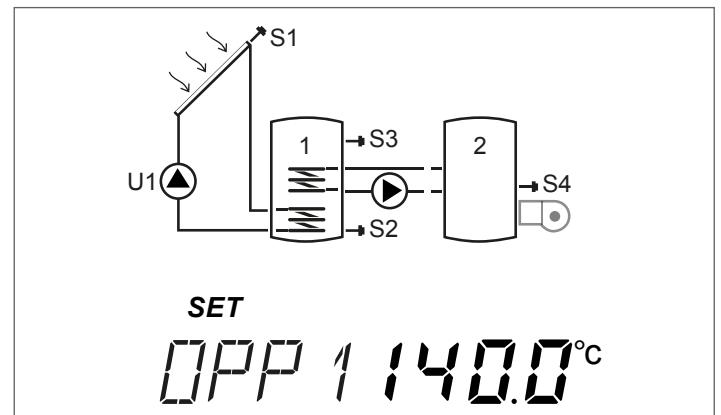

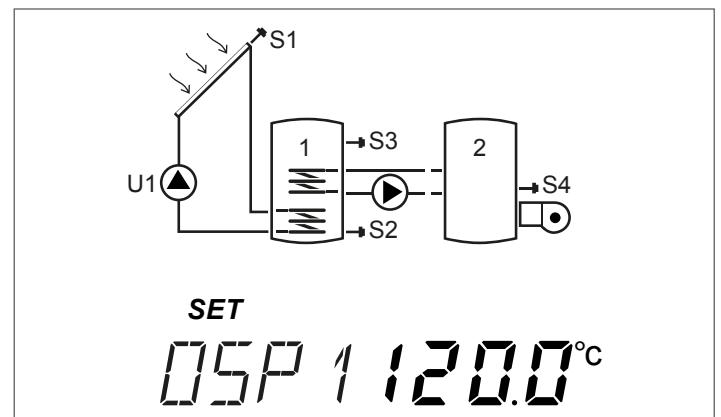

- SOLAR PANEL 1 ANTI-STAGNATION FUNCTION START TEMPERATURE - OSP1 (120°C)
- SOLAR PANEL 1 ANTISHOCK FUNCTION START TEMPERATURE - OPP1 (140°C)
- SOLAR PANEL 2 ANTI-STAGNATION FUNCTION START TEMPERATURE (120°C)
- SOLAR PANEL 2 ANTISHOCK FUNCTION START TEMPERATURE (140°C)
- SAFETY STOP MAXIMUM TEMPERATURE B011 - B1ST (85°C)
- SAFETY STOP MAXIMUM TEMPERATURE B012 - B2ST (85°C)
- ANTI-STAGNATION DEACTIVATION COLLECTOR TEMPERATURE THRESHOLD CONSTANT (90°C Constant, non-adjustable value)

Conditions required for anti-stagnation function start:

- Temperature of accumulation tank S3 (S4) lower than the value set with parameter B1ST (B2ST)
- The temperature of collector S1 (S6) must be greater than the value set in parameter OSP1 (OPP2)
- The temperature of collector S1 (S6) must be lower than the value set in parameter OPP1 (OPP2)

Conditions required for anti-stagnation function stop:

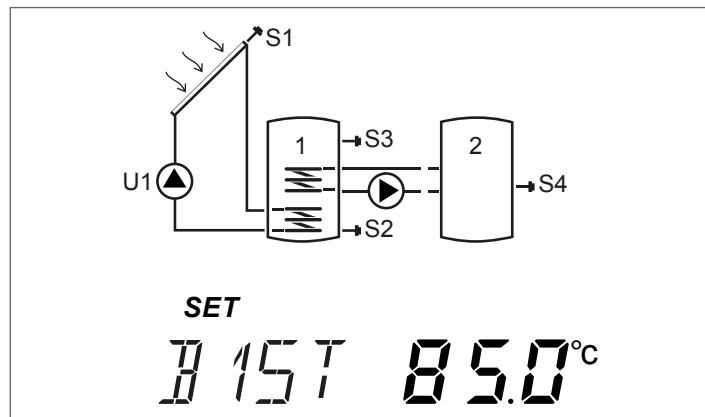

- Temperature of collector S1 (S6) lower than 90°C
- Temperature of collector S1 (S6) greater than the value set in parameter OPP1 (OPP2)
- Temperature of accumulation tank S3 (S4) greater than or equal to the value set in parameter B1ST (B2ST)

3.22 Accumulation tank 1-2 safety stop maximum temperature

B1ST-B2ST (par. no.: 178-181)

With this parameter it is possible to set the accumulation tank temperature, over which it is necessary to stop any anti-stagnation and heat exchange function.

3.23 Anti-thermal shock function

ASCK (par. no.: 182)

Anti-thermal shock function allows to protect solar collectors in case of excessive increase of collector temperature (higher than the value set in parameter OPP1-2) through the operation of the pump by pulses of adjustable duration.

This parameter allows to activate the anti-thermal shock function.

The function activation is signalled by icon flashing at 0.5 second frequency.

ON function enabled
OFF function disabled

The anti-thermal shock function is adjusted through the following programmable parameters:

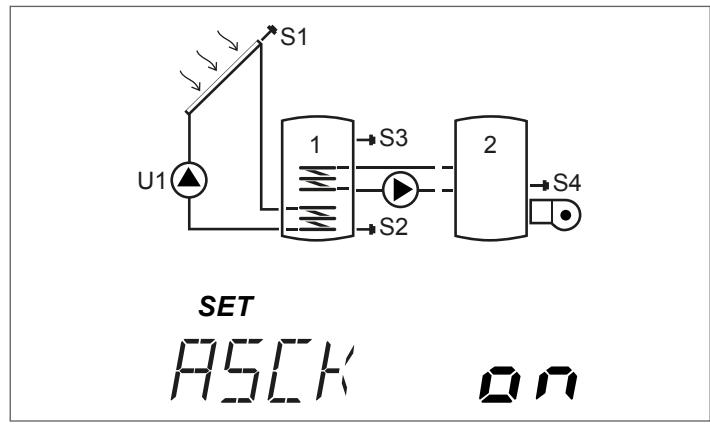

- ANTI-THERMAL SHOCK FUNCTION ACTIVATION - ASCK (ON)
- SOLAR PANEL 1/2 ANTISHOCK FUNCTION START TEMPERATURE - OPP1/OPP2 (140°C)
- ANTI-THERMAL SHOCK FUNCTION STOP THRESHOLD - ASST (120°C)
- ACCUMULATION TANK 1/2 SAFETY STOP MAXIMUM TEMPERATURE - B1ST/B2ST (85°C)
- PUMP OFF INTERVAL TIMER DURING ANTI-THERMAL SHOCK FUNCTION - TSOF (60s)
- PUMP ON INTERVAL TIMER DURING ANTI-THERMAL SHOCK FUNCTION - TSON (3s)
- PUMP SPEED IN ANTISHOCK MODE - ASPE (100%)

Conditions required for anti-thermal shock function start:

- Temperature of collector S1 (S6) greater than the value set at parameter "SOLAR PANEL 1-2 OVERTEMPERATURE FUNCTION STOP THRESHOLD" (par. no.: 169-175)
- Temperature of accumulation tank S3 (S4) lower than the value set at parameter "ACCUMULATION TANK 1-2 SAFETY STOP MAXIMUM TEMPERATURE" (par. no.: 178-181)

Conditions required for anti-thermal shock function stop:

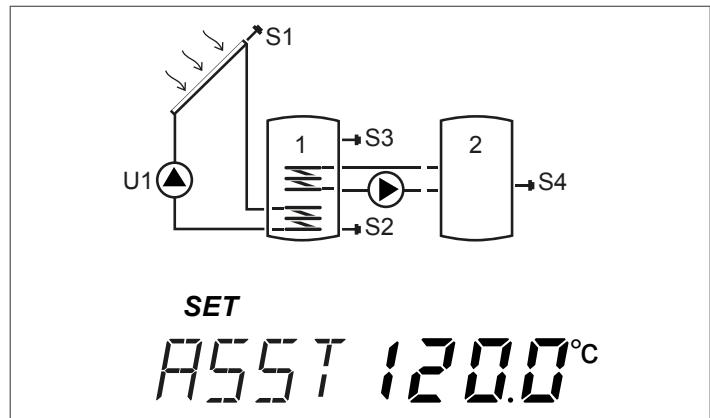

- Temperature of collector S1 (S6) lower than the value set at parameter "ANTI-THERMAL SHOCK FUNCTION STOP THRESHOLD" (par. no.: 183)
- Temperature of accumulation tank S3 (S4) higher than or equal to the value set at parameter "ACCUMULATION TANK 1-2 SAFETY STOP MAXIMUM TEMPERATURE" (par. no.: 178-181)

3.24 Anti-thermal shock function stop threshold

ASST (par. no.: 183)

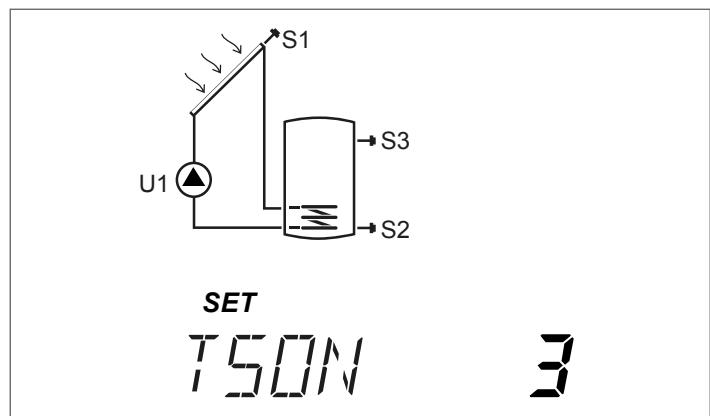

With this parameter it is possible to set the collector temperature threshold under which anti-thermal shock function is deactivated.

3.25 Pump on interval during anti-thermal shock function

TSON (par. no.: 184)

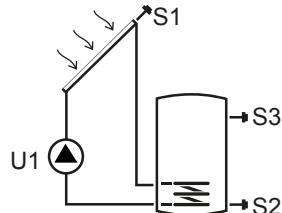

With this parameter it is possible to set the pump pulse duration during anti-thermal shock function.

3.26 Pump off interval during anti-thermal shock function

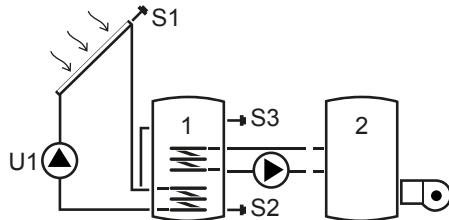

TSOF (par. no.: 185)

With this parameter it is possible to set the duration of the pause period between two pump pulses.

SET

TSOF 60

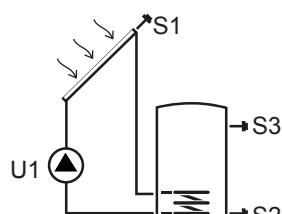

SET OFF

BRU 18uto

3.27 Pump speed in antishock mode

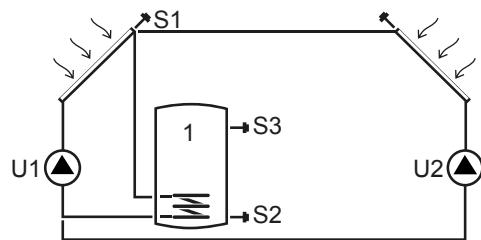

ASPE (par. no.: 186)

With this parameter it is possible to set the percentage speed of the pump during the pulse.

SET

ASPE 100

SET OFF

APS 1 on

3.28 Enabling supplementary system

BRU1 (par. no.: 187)

With this parameter, it is possible to set the burner/integration system activation mode:

- OFF** The burner/integration system is not activated
- ON** The burner/supplementary system is activated once the temperature set in parameter "SUPPLEMENT ACTIVATION THRESHOLD" is reached (par. no.: 91), regardless of the schedule set
- AUTO** The burner/supplementary system is activated if the temperature set in parameter "SUPPLEMENT ACTIVATION THRESHOLD" is reached (par. no.: 91) and the system is in the ON time interval.

3.30 Thermal disinfection function (anti-legionella)

DTON (par. no.: 193)

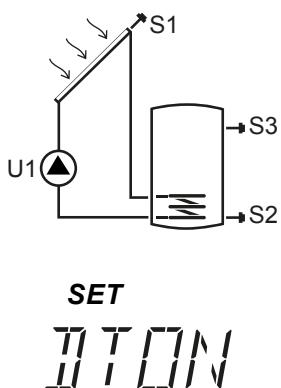

With this parameter it is possible to activate the thermal disinfection function to protect the accumulation tank from legionella.

Probe S3 monitors the domestic hot water temperature in the upper zone of the accumulation tank.

To complete an anti-legionella cycle it is necessary that, during the monitoring period PRDM, the temperature of probe S3 is higher than the value set in parameter TMPD, for the whole heating period PRDR. If this occurs, the cycle is over and a new monitoring period will start as soon as the temperature of S3 is lower than TMPD. If during monitoring period PRDM no complete cycle was performed, at the end of this period output U2 is activated to control an auxiliary heater in order to increase the accumulation tank temperature above the value set in TMPD.

The thermal disinfection function (available in systems 1, 3 and 8) is managed through the following parameters:

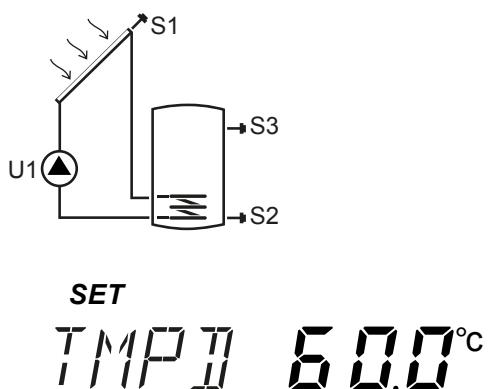

- THERMAL DISINFECTION FUNCTION ACTIVATION - DTON (ON)
- THERMAL DISINFECTION TEMPERATURE - TMPD (60°C)
- THERMAL DISINFECTION MONITORING PERIOD - PRDM (01:00)
- THERMAL DISINFECTION HEATING PERIOD - PRDR (01:00)
- THERMAL DISINFECTION IN PROGRESS COUNTER - CNTD
- THERMAL DISINFECTION DELAYED ACTIVATION TIME - ORAD (00:00)

3.31 Thermal disinfection temperature

TMPD (par. no.: 194)

With this parameter it is possible to set the disinfection temperature of the upper part of the accumulation tank.

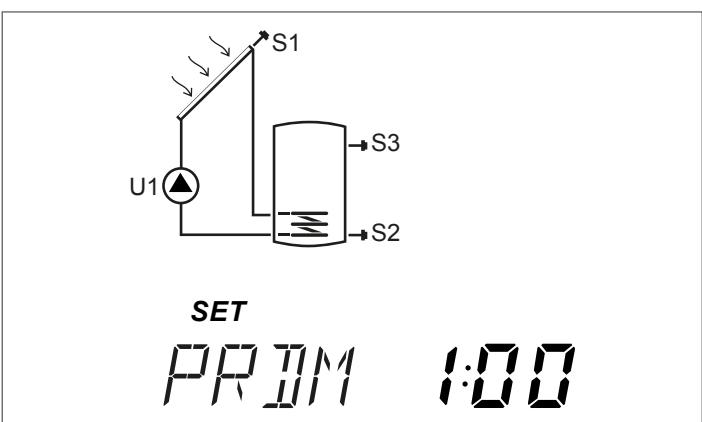

3.32 Thermal disinfection monitoring period

PRDM (par. no.: 195)

With this parameter it is possible to set the monitoring period of the accumulation tank temperature..

The setting range is: 0..30:0..24 (dd:hh)

The monitoring period starts as soon as the temperature detected by probe S3 is lower than disinfection temperature TMPD. If the temperature detected by S3 is constantly higher than TMPD, for the whole heating period PRDR, thermal disinfection is over and a new monitoring period starts.

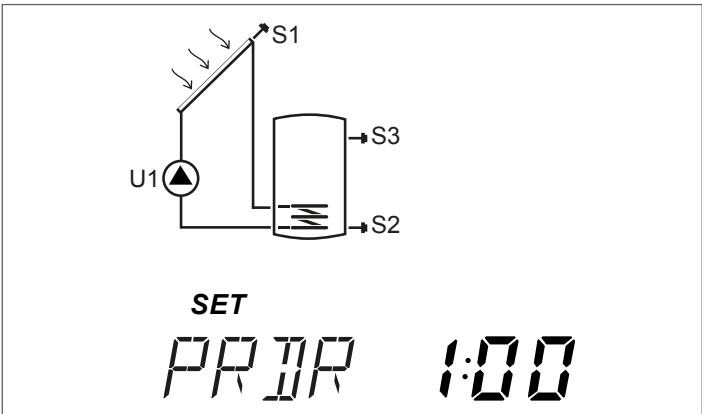

3.33 Thermal disinfection heating period

PRDR (par. no.: 196)

With this parameter it is possible to set the accumulation tank heating activation period during which the temperature detected by S3 must be higher than TMPD.

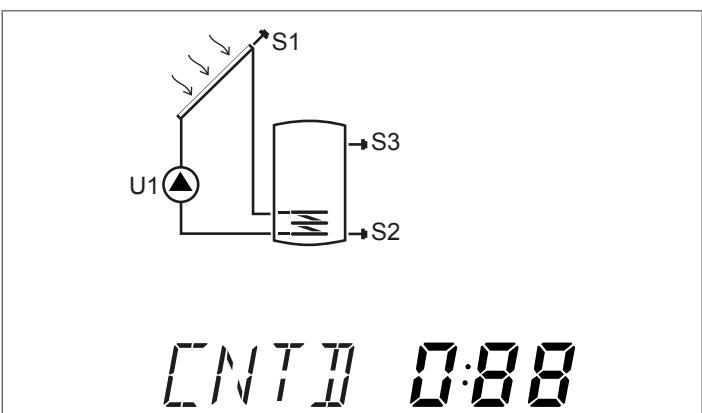

The setting range is: 0..24:0..59 (hh:mm).

3.34 Thermal disinfection in progress counter

CNTD (par. no.: 197)

With this parameter it is possible to display the countdown of remaining hours to monitoring period PRDM.

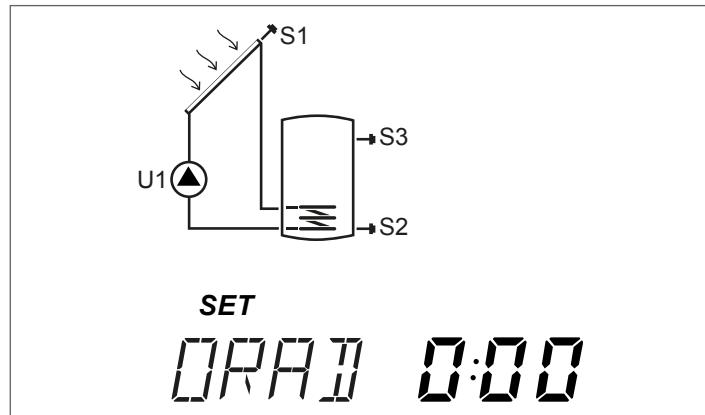

3.35 Thermal disinfection delayed activation time

ORAD (par. no.: 198)

With this parameter it is possible to postpone the activation time of the auxiliary heater.

In particular, if the time set in parameter ORAD is subsequent to the moment in which the monitoring period ends, output U2 is activated at the time set in parameter ORAD, instead if the time set precedes the moment in which the monitoring period ends, output U2 is activated at the end of the monitoring period.

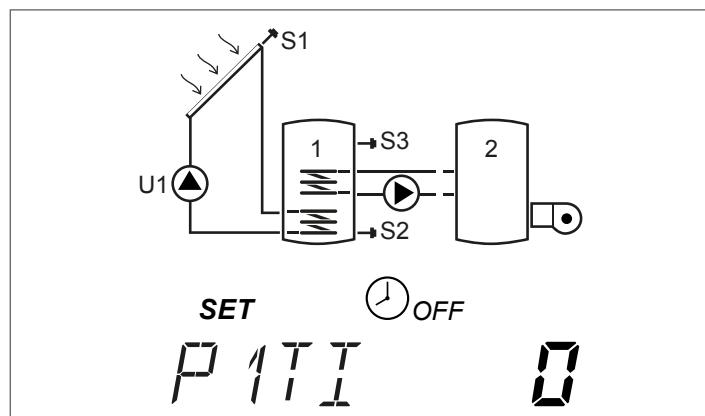

3.36 Operating hours output U1-U2

P1TI-P2TI-P3TI-P4TI (par. no.: 199-201-203-205)

With these parameters it is possible to display and reset the operating hours of circulators. To reset operating hours, press "▲" for a few seconds, until the value is reset.

Circulators are indicated as P1 – P2 – P3 – P4, according to the system layout.

3.37 Accumulation tank 1 – accumulation tank 2 night cooling function

NCB1-NCB2 (par. no.: 208-211)

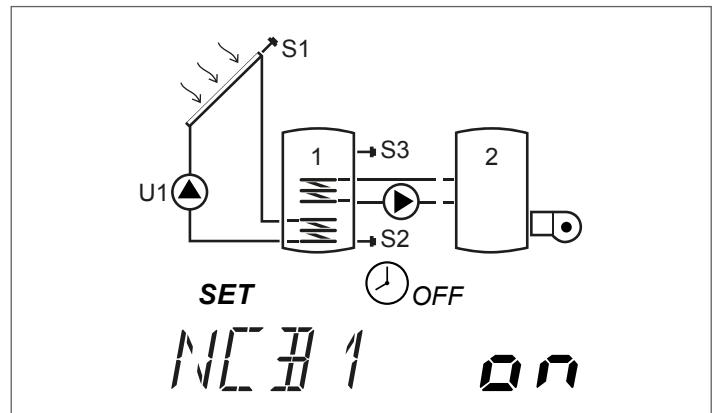

With this parameter, it is possible to enable/disable the night cooling function of storage systems 1 and 2.

The night cooling function allows decreasing the temperature of storage systems at night to limit frequent activations of anti-stagnation function in the hottest periods.

The night cooling function activation is signalled by icons ☀ and ✎ flashing at 0.5 second frequency.

The night cooling function is set through the following programmable and non-programmable parameters:

- NIGHT COOLING FUNCTION B0I1 - NCB1 (ON)
- NIGHT COOLING FUNCTION B0I2 - NCB2 (ON)
- NIGHT_COOLING_ACTIVATION_COLLECTOR_TEMPERATURE_CONSTANT (90°C Constant, non-adjustable value)
- NIGHT_COOLING_ACTIVATION_UPPER_STORAGE_SYSTEM_TEMPERATURE_CONSTANT (85°C Constant, non-adjustable value)
- NIGHT_COOLING_DEACTIVATION_UPPER_STORAGE_SYSTEM_TEMPERATURE_CONSTANT (75°C Constant, non-adjustable value)
- NIGHT_COOLING_DEACTIVATION_PSOLX_TEMPERATURE_CONSTANT (95°C Constant, non-adjustable value)
- EVENING_NIGHT_COOLING_ACTIVATION_TIME_CONSTANT (10.00PM Constant, non-adjustable value)
- EVENING_NIGHT_COOLING_DEACTIVATION_TIME_CONSTANT (11.59PM Constant, non-adjustable value)
- NIGHTTIME_NIGHT_COOLING_ACTIVATION_TIME_CONSTANT (12.00AM Constant, non-adjustable value)
- NIGHTTIME_NIGHT_COOLING_DEACTIVATION_TIME_CONSTANT (05.00AM Constant, non-adjustable value)

Example

For storage system 1 with B0I1=ON, the function is active from 10:00 PM to 5:00 AM.

It is activated if S1<90°C and if S3<85°C.

It is deactivated if one of the following conditions is verified:

- S1<75°C;
- S1>95°C;
- outside the indicated time interval.

Example

For storage system 2 (system 2) with B0I2=ON, the function is active from 10:00 PM to 5:00 AM.

It is activated if S3<90°C and if S4<85°C.

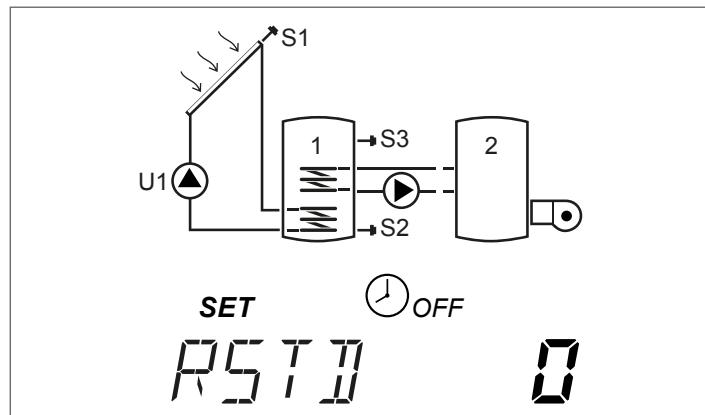

It is deactivated if one of the following conditions is verified:

- S3<75°C;
- S3>95°C;
- outside the indicated time interval.

3.38 Restore Default parameters

RSTD (par. no.: 247)

Set this parameter to 1 to restart the controller and restore factory settings.

3.39 Control unit modbus address

ADMB (par. no.: 250)

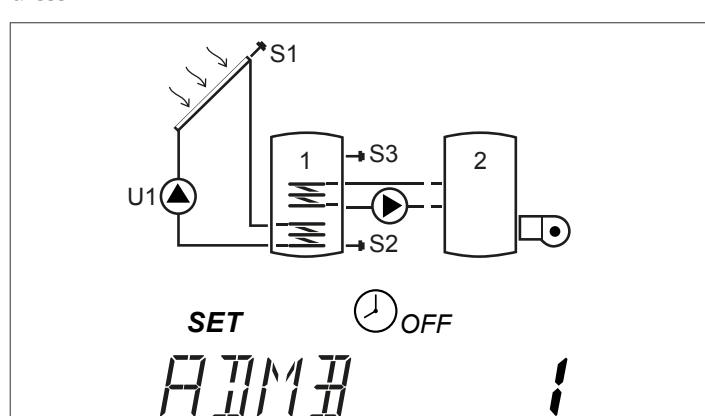

The solar regulator is enabled for interconnection on a data line RS-485 through Modbus RTU protocol in SLAVE mode.

Therefore it is possible to create a SINGLE-SLAVE/MULTI-SLAVE network

Ex. Data logging of 3 cascade control units (SLAVE) through pc protocol (MASTER):

- 1 Set parameter "CONTROL UNIT MODBUS ADDRESS" (par. no.: 250) of 1st control unit =1
- 2 Set parameter "CONTROL UNIT MODBUS ADDRESS" (par. no.: 250) of 2nd control unit =2
- 3 Set parameter "CONTROL UNIT MODBUS ADDRESS" (par. no.: 250) of 3rd control unit =3
- 4 Remove jumpers from Y3 on all SLAVE control units
- 5 Remove jumper from J4 on control units SLAVE 2 and SLAVE 3
- 6 Connect adapter RS-485/USB (not supplied) or RS-485/Lan (not supplied) to the pc
- 7 Power the devices

The parameter ADMB allows setting the solar regulator slave address

4 PUTTING INTO SERVICE

4.1 Initial startup

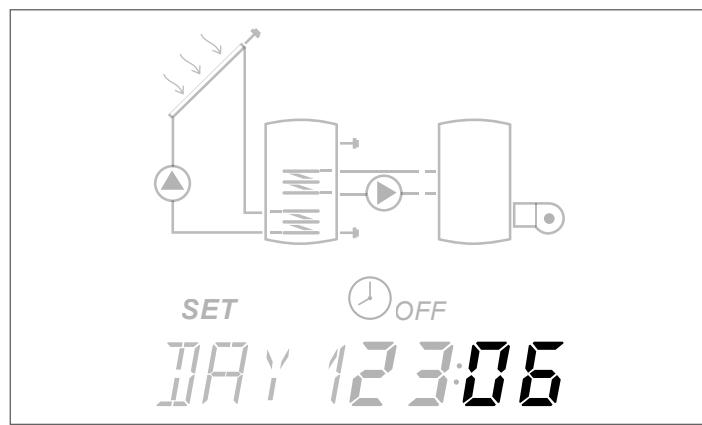

Upon commissioning or after a reset, it is necessary to set current time/day/language and system layout number.

4.1.1 Current time and week day display

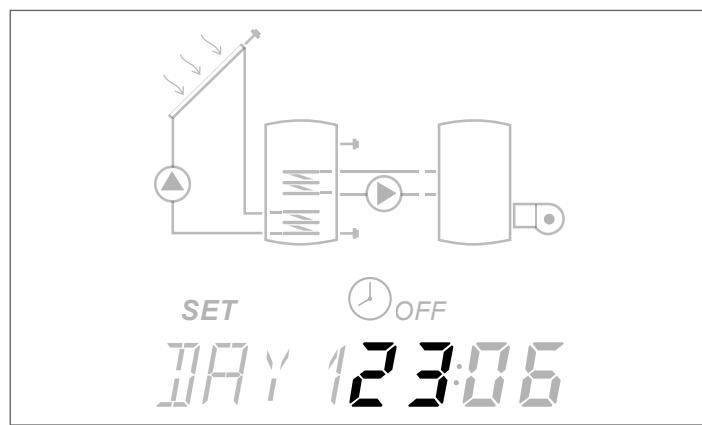

Press "▼" for 2 seconds to display time and week day
Press "►" or "◀" to exit the page

4.1.2 Setting up current time, week day and language

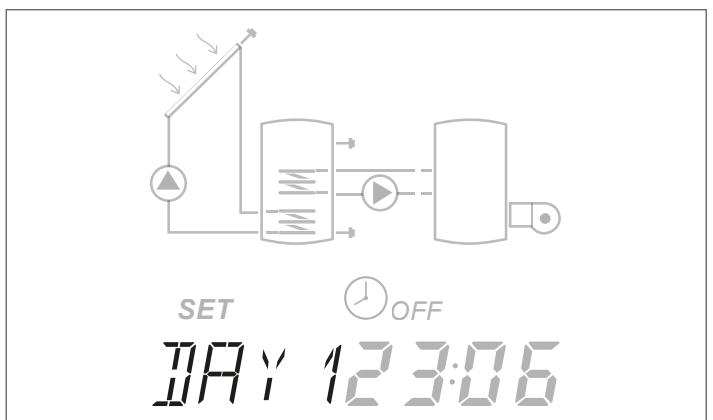

Press "▼" for 5 seconds to edit time, week day and language
- Press "▲" or "▼" to set minutes

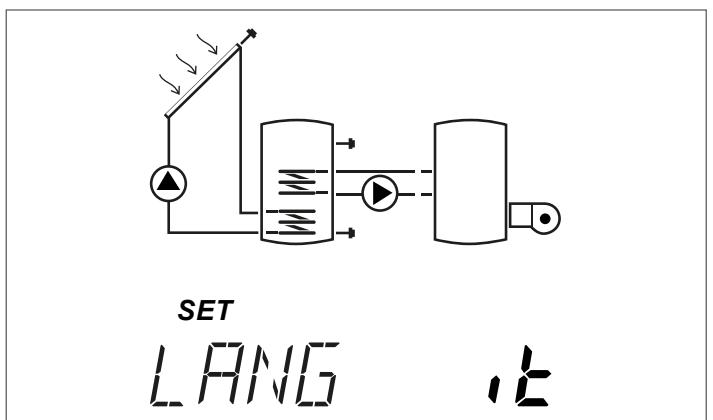

- Press key "◀" to confirm
- Press "▲" or "▼" to set hours

- Press key "◀" to confirm
- Press "▲" or "▼" to set the week day; **DAY1** corresponds to Monday – **DAY7** to Sunday

- Press key "◀" to confirm
- Press "▲" or "▼" to set the controller language !da du-plicazione! (available languages are it-en-de-fr)

Press key "◀" to confirm and exit the change.

- !** In case of power supply missing for longer than three days, only date and time must be reset.
- !** It is possible to exit the setup mode at any stage (for example, after setting the minutes), pressing the "◀" button for at least 2 seconds.

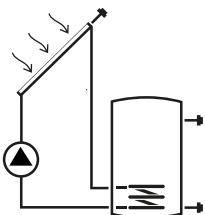

4.1.3 Enter Password

To access Installer parameters, it is necessary to enter the **password: 0000**.

If the password is correct Installer parameters will be displayed. If the password is incorrect, the default screen (parameter S3) is displayed and the procedure must be repeated.

After a period of inactivity of 5 minutes (no button pressed), Installer functions are disabled and the display goes back to the previous screen. To access again Installer functions it is necessary to enter the password again.

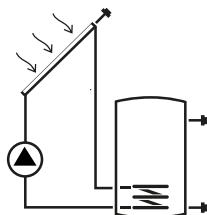

- Press "◀" for 5 seconds.
- Press "▲" or "▼" until "0" is displayed

SET

PW35_ _ _ 0

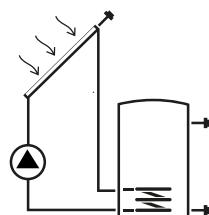

- Press key "◀" to confirm
- Press "▲" or "▼" until "0" is displayed

SET

PW350_ _ _

- Press key "◀" to confirm
- Press "▲" or "▼" until "0" is displayed

SET

PW35_ _ 0_

- If necessary, it is possible to go back and change the figures previously confirmed with button "▶"
- Press key "◀" to confirm the password.

4.1.4 System layout configuration

The solar regulator manages 9 system layouts that can be selected through parameter **SYSN** (system number).

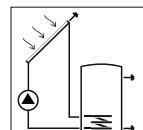

If no system is set, system no. 1 is enabled by default.

Overview of system layouts:

IMP 1: Standard solar system

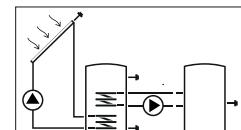

IMP 2: Solar system with heat transfer

IMP 1

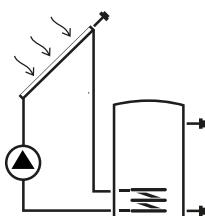

SYSN

IMP 2

SYSN

- Press key "◀" to confirm
- Press "▲" or "▼" until "0" is displayed

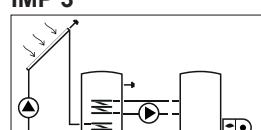

SET

PW35_0_ _

IMP 3: Solar system with supplementary heating

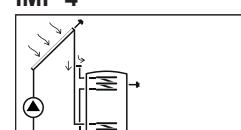

IMP 4: Solar system with stratified filling of the accumulation tank

IMP 3

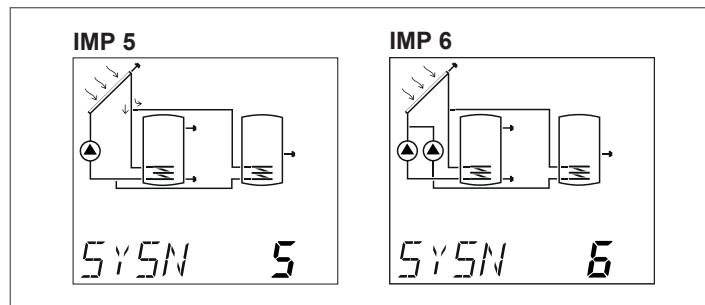

SYSN

IMP 4

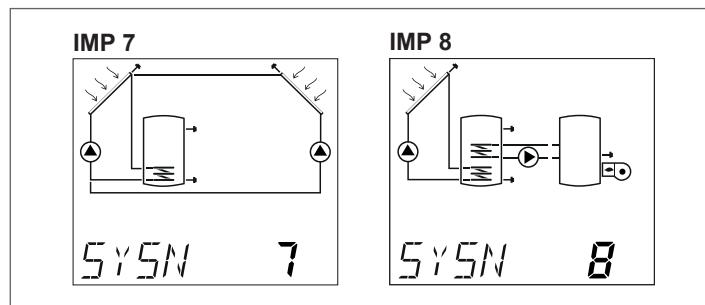

SYSN

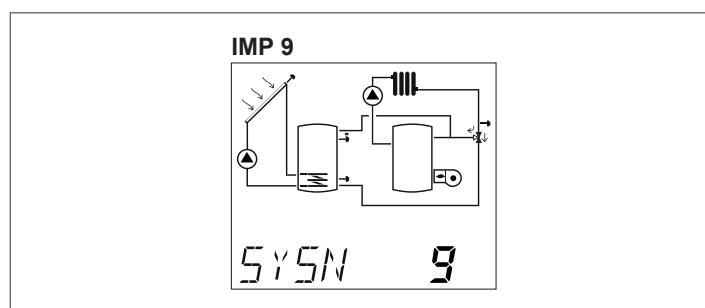

IMP 5: Solar system with 2 accumulation tanks and priority logics
 IMP 6: Solar system with 2 accumulation tanks and operation with pumps

IMP 7: Solar system with 2 collectors and 1 accumulation tank
 IMP 8: SOLAR SYSTEM WITH SUPPLEMENTARY HEATING THROUGH PUMP ACTING ON SOLID FUEL GENERATOR

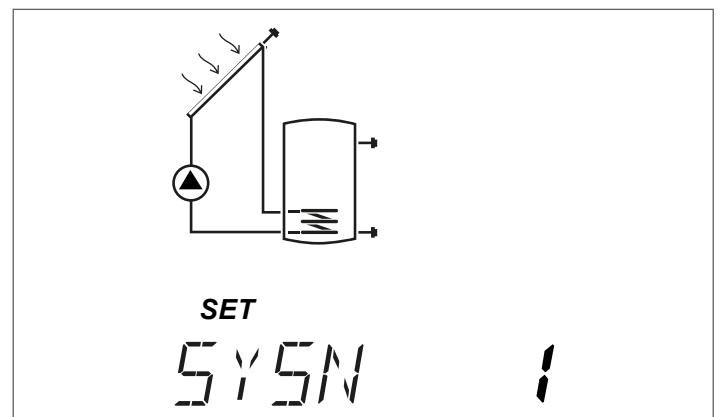

IMP 9: Solar system with temperature increase system in heating circuit return

To change the system layout after entering the password:

- Press "►" until parameter **NUMERO SISTEMA – SYSN** is displayed

- Press "▲" for at least 3 seconds to enter parameter editing mode. The icon "SET" and the system layout number start flashing
- Scroll the various system layouts by pressing "▲" or "▼" until the correct layout number is displayed
- Confirm the change by pressing "►" or "◀" for at least 3 seconds.

! Indicate the configured layout in the user manual in the chapter "System layouts".

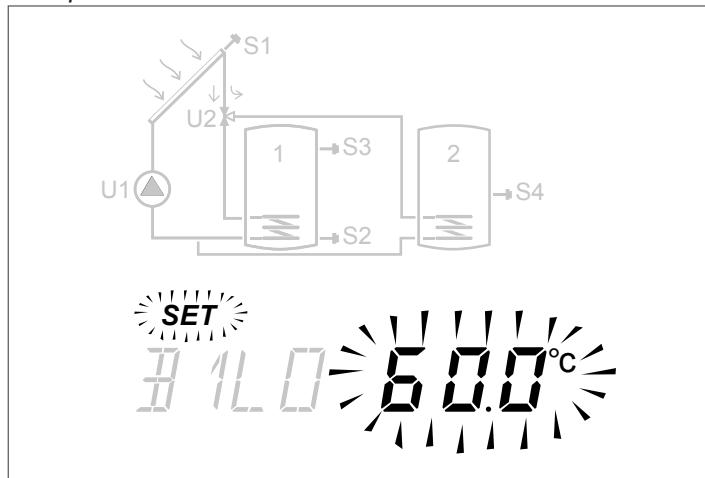

4.1.5 Change installer parameters

! When changing parameters all functions are active at the default or previously set values. For example, if the conditions for activation of the pump associated with the output U1 are met, the corresponding pump will operate.

To edit the displayed parameter:

Press "▲" for a few seconds to enter edit mode, the icon **SET** and the parameter value start flashing.

Example:

Press "▲" or "▼" to edit.

Press "►" or "◀" for at least 3 seconds to confirm the change and go back to the parameter list.

! In case of error in parameter editing, repeat the procedure.

For instructions and settings of the individual parameters refer to chapter "Parameter description".

For each system layout, chapter "Installation diagrams" contains the basic wiring diagram and the list of dedicated parameters, each with the default value and the allowed range.

4.1.6 Change weekly time schedule

Set up as follows:

- Press "▲" for at least 3 seconds, the icon **SET** starts flashing
- Press "▲" to activate, the time indicated and the icon **ON** flash to confirm the activation
- Press "▼" to deactivate, the time indicated and the icon **OFF** flash to confirm the deactivation

For convenience, press and hold "▲" or "▼" during programming to set sequentially the time intervals ON or OFF respectively. When user completes programming of the 48 half hours of the day, the parameter will go back to display status.

It is possible to exit the setting page before having programmed the whole 48 half hours by pressing "►" for a few seconds.

For systems that use a supplementary heating system with a timer (system no.3), the following schedule is stored by default.

START	STOP	TIME BAR	MON	TUE	WED	THU	FRI	SAT	SUN
0:00	0:30	0							
0:30	1:00	1							
1:00	1:30	2

22:30	23:00	45							
23:00	23:30	46							OFF
23:30	0:00	47							

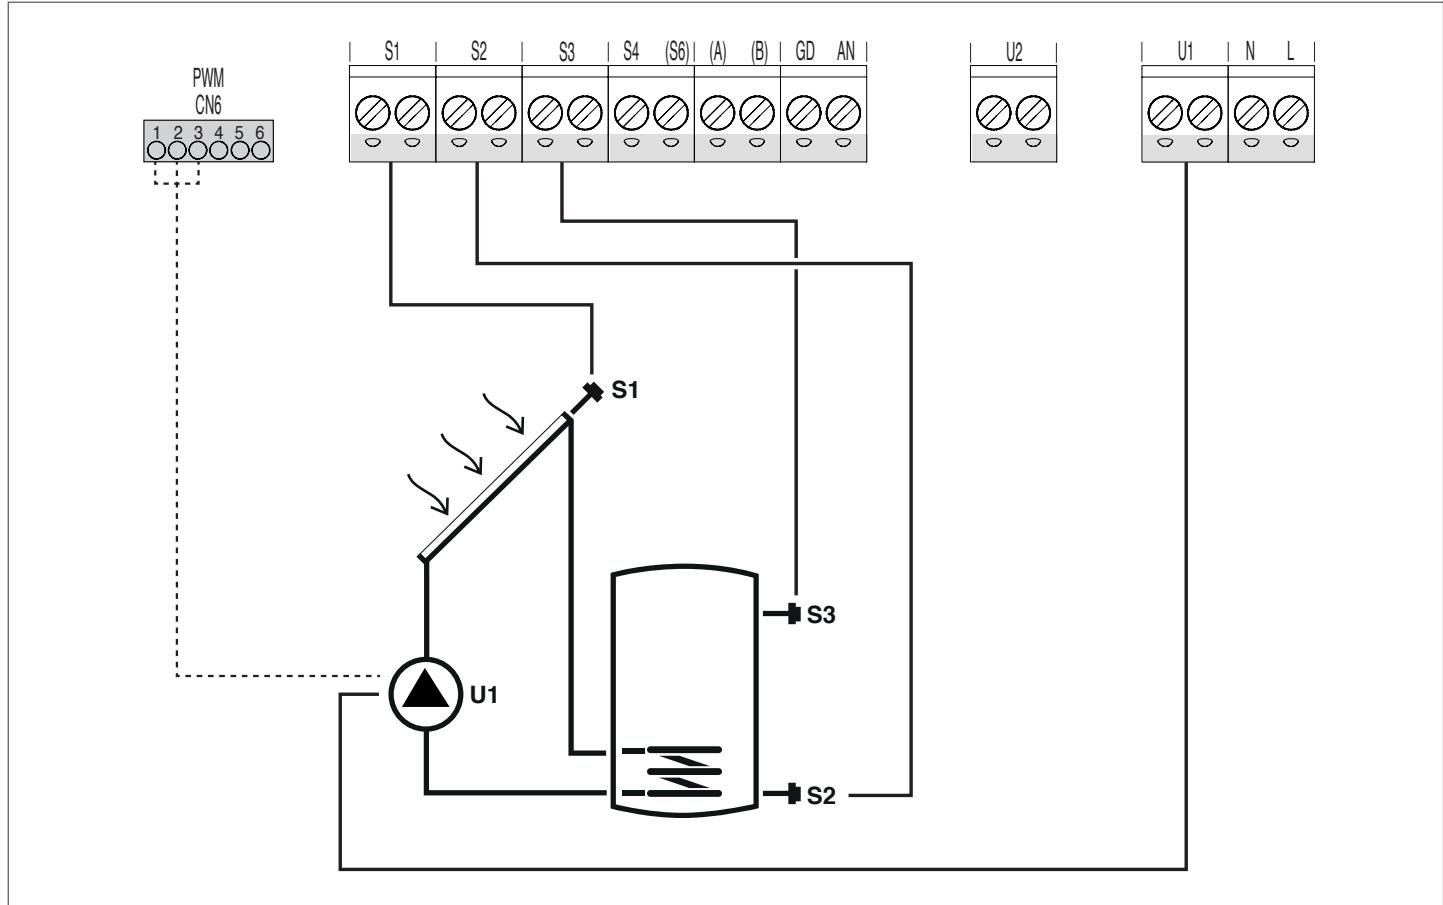

In the boxes indicate the time schedule set.

5 INSTALLATION DIAGRAMS

System 1 – SOLAR HEATING WITH 1 STORAGE SYSTEM

The system works on the temperature difference between solar collector (S1) and the low zone of storage system (S2) to maintain the storage temperature set in parameter n°59 (B1LO SETPOINT BOILER1 LOW).

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated. The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

System 2 – SOLAR HEATING WITH HEAT TRANSFER

The system works on the temperature difference between solar collector (S1) and the low zone of the first storage system (S2) to maintain the storage 1 temperature set in parameter no. 59 (B1LO – SETPOINT BOILER1 LOW). It also works on the temperature difference between the high zone of the first storage (S3) and the low zone of the second storage system (S4) to maintain the storage 2 temperature set in parameter no. 64 (B2LO – SETPOINT BOILER2 LOW).

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated. The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

If the difference S3-S4 is greater than or equal to the value set in parameter n°16 (ON34) and probe S3>ST12, the pump connected to output U2 is activated.

The pump (U2) remains active until the temperature difference between S3 and S4 reaches the value set in parameter n°17 (OF34).

System 3 – SOLAR SYSTEM WITH SUPPLEMENTARY HEATING

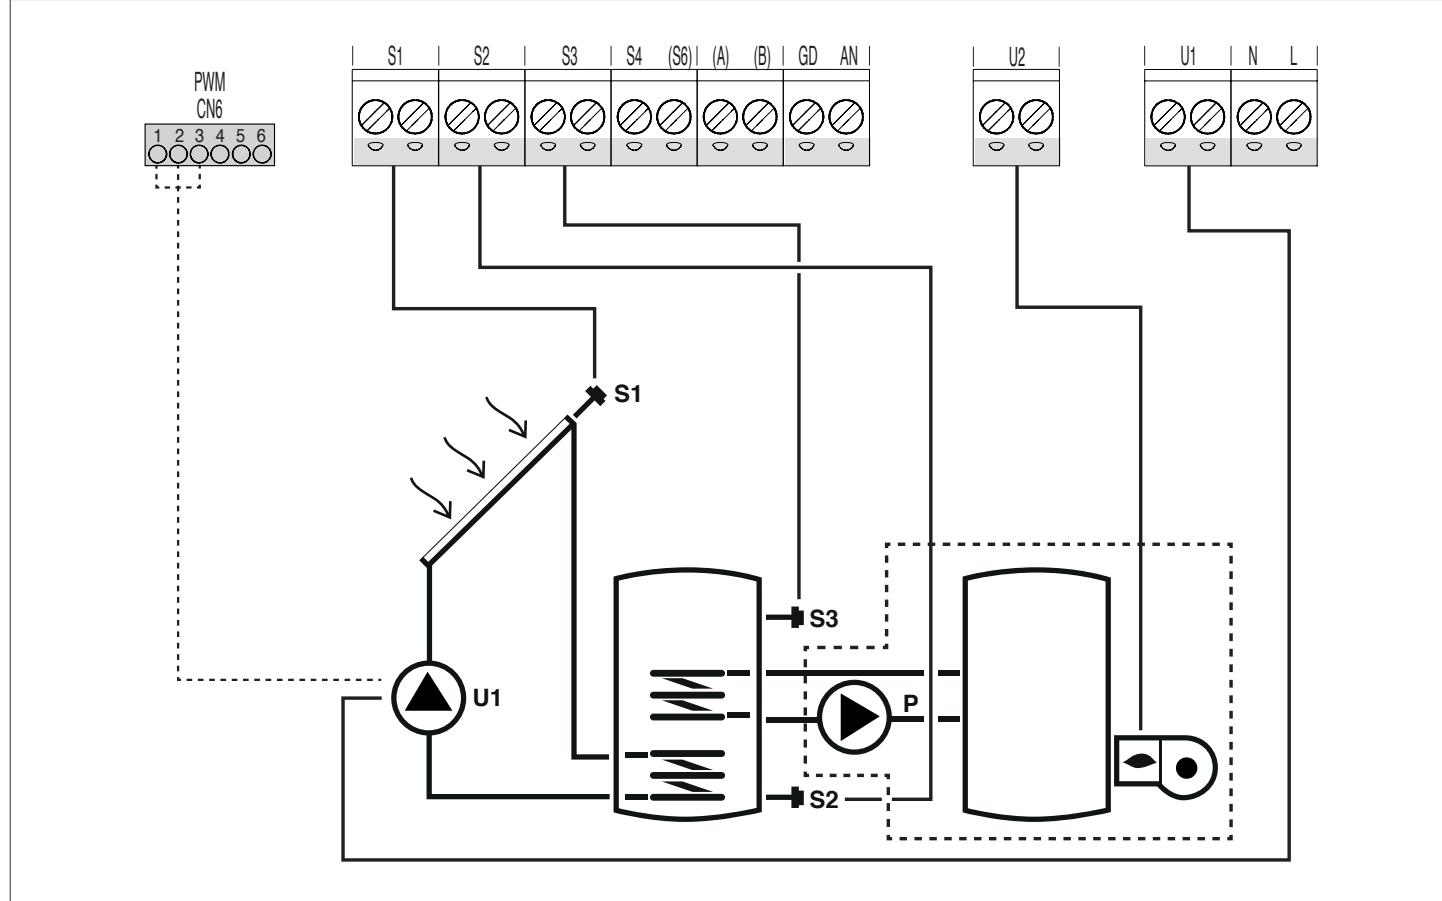

The system works on the temperature difference between solar collector (S1) and the low zone of storage system (S2) to maintain the storage temperature set in parameter n°59 (B1LO SETPOINT BOILER1 LOW).

A supplementary heating, activated through time schedule with parameters n°103÷109 (DAYn), is used as supplement to the solar collector.

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated.

The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

Through the schedule set in parameters DAYn it is possible to take advantage of a supplementary system to integrate heat exchange between solar collectors and accumulation tank.

System 4 – SOLAR SYSTEM WITH STRATIFIED FILLING OF THE STORAGE SYSTEM

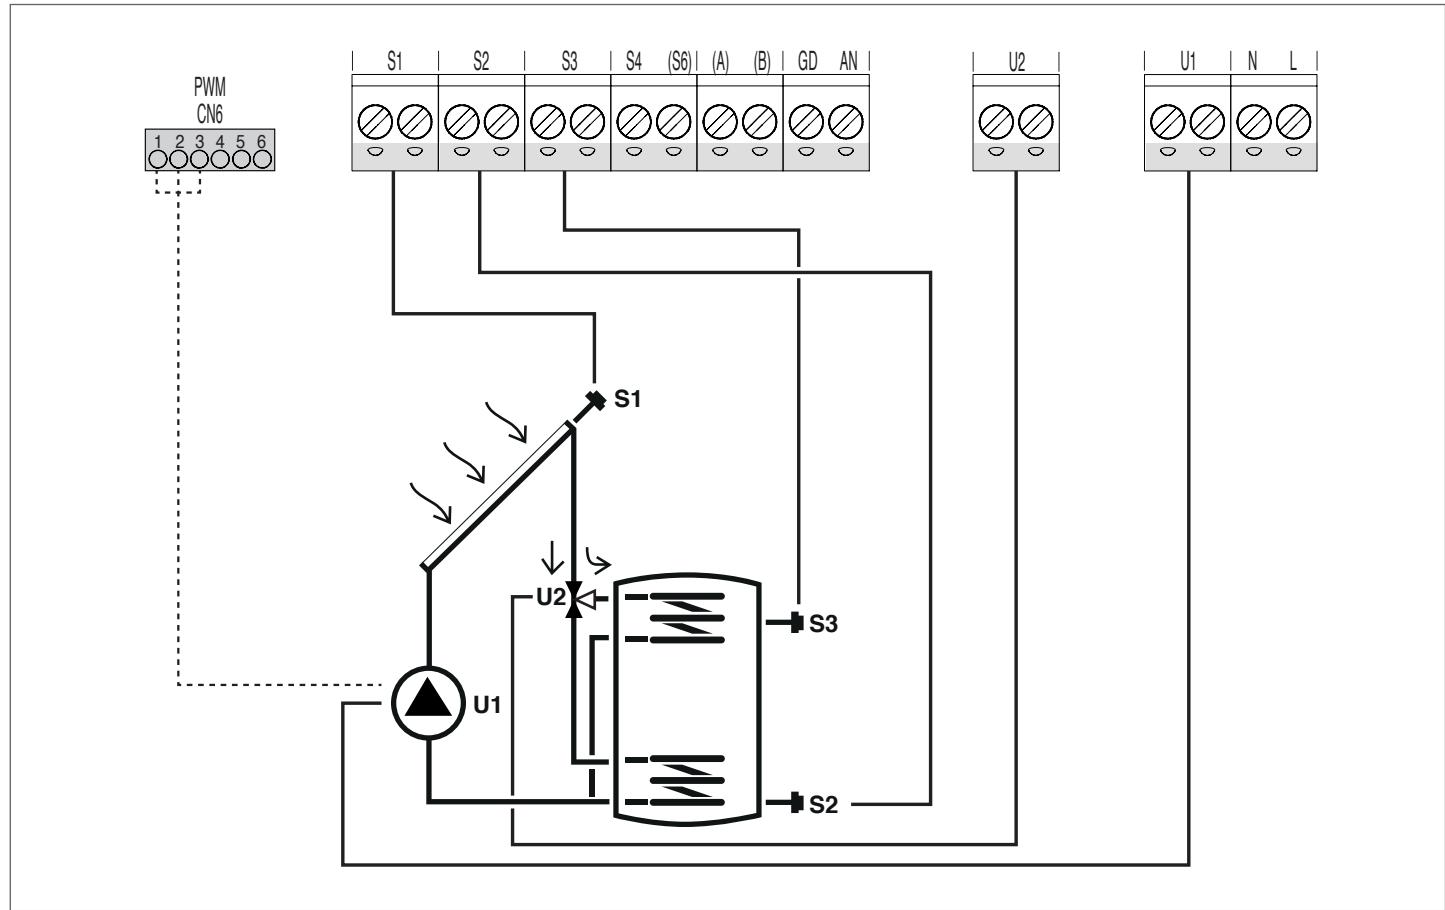

The system makes it possible to heat two storage zones at different times, allowing the choice of which of the two zones has time priority over the other. Through parameter n°67 (PZB1) it is possible to change priority of the zone to be heated (high zone by default). The system works on the temperature difference between solar collector (S1) and the storage system both to heat the high zone (S3) and maintain the temperature set in parameter n°56 (B1HI – SETPOINT BOILER1 HIGH) as well as to heat the low zone (S2) and maintain the temperature set in parameter n°59 (B1LO – SETPOINT BOILER1 LOW). Thus, it is possible to manage the storage system heating, controlling the stratification between high zone (S3) and low zone (S2).

If the difference S1-S3 is greater than or equal to the value set in parameter n°10 (ON13), the pump connected to output U1 is activated and the solenoid valve connected to output U2 changes over to allow for circulation between the solar collector and the storage system high zone (contact of output U2 closed).

The pump (U1) remains active until the difference reaches the value set in parameter n°11 (OF13).

If the difference S1-S3 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated and the solenoid valve connected to output U2 changes over to allow for circulation between the solar collector and the storage system low zone (contact of output U2 open).

The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

System 5 – SOLAR SYSTEM WITH 2 TANKS AND PRIORITY LOGICS

The system works on the temperature difference between solar collector (S1) and the low zone of the first storage system (S2) to maintain the storage 1 temperature set in parameter n°59 (B1LO – SETPOINT BOILER1 LOW). It also works on the temperature difference between solar collector (S1) and the low zone of the second storage system (S4) to maintain the storage 2 temperature set in parameter n°64 (B2LO – SETPOINT BOILER2 LOW).

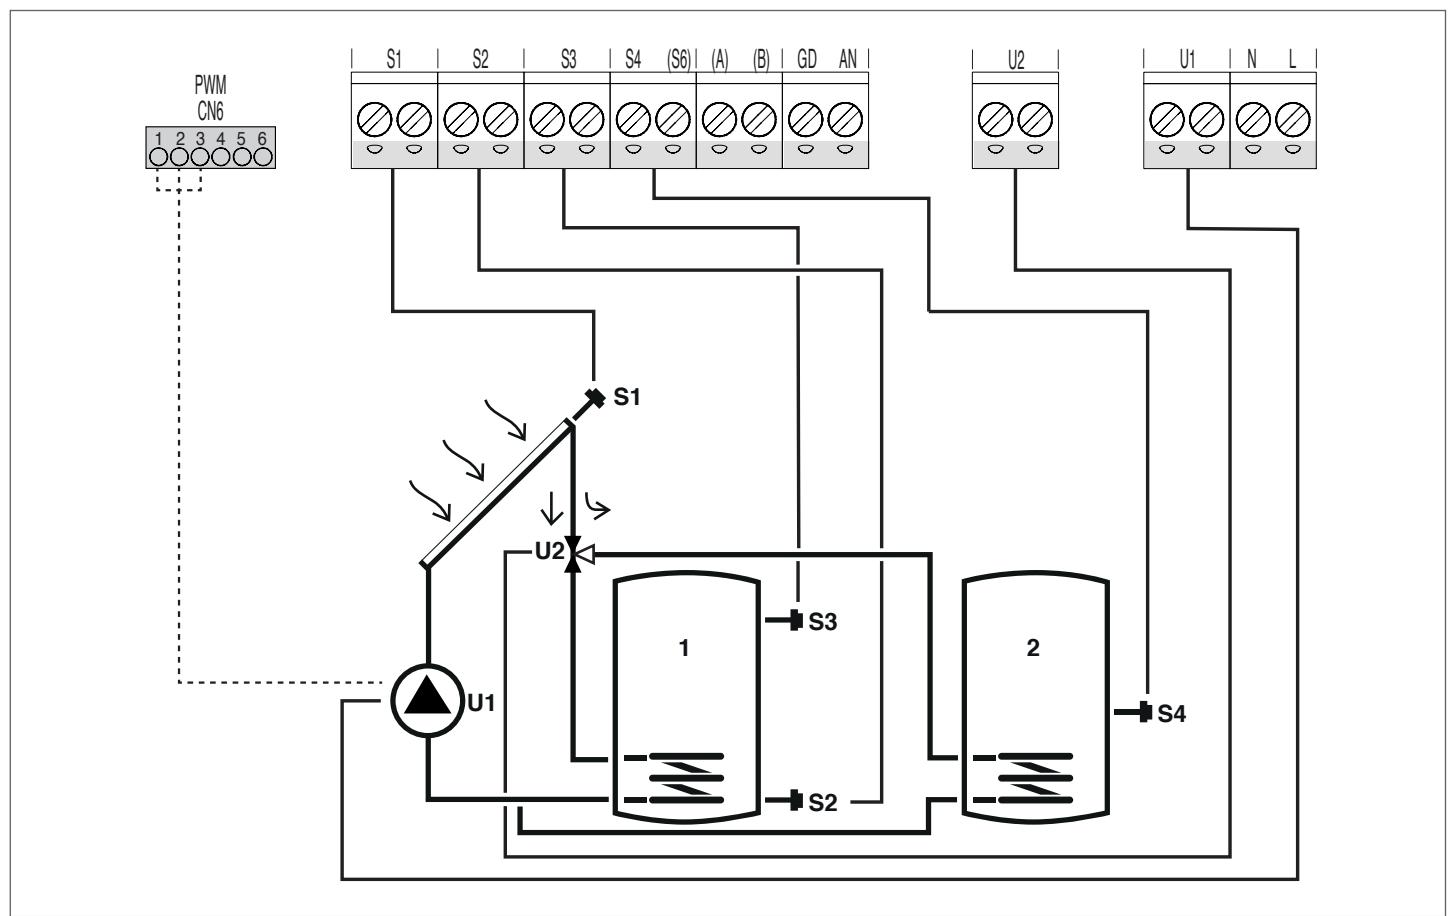

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated and the solenoid valve connected to output U2 changes over to allow for circulation between the solar collector and the storage system 1 low zone (contact of output U2 open).

The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

If the difference S1-S4 is greater than or equal to the value set in parameter n°12 (ON14), the pump connected to output U1 is activated and the solenoid valve connected to output U2 changes over to allow for circulation between the solar collector and the storage system 2 low zone (contact of output U2 closed).

The pump (U1) remains active until the temperature difference between S1 and S4 reaches the value set in parameter n°13 (OF14).

It is possible to change the priority of the accumulation tank to be heated with parameter n°53 (PRBO) (first accumulation tank by default).

System 6 – SOLAR SYSTEM WITH 2 TANKS AND OPERATION WITH PUMPS

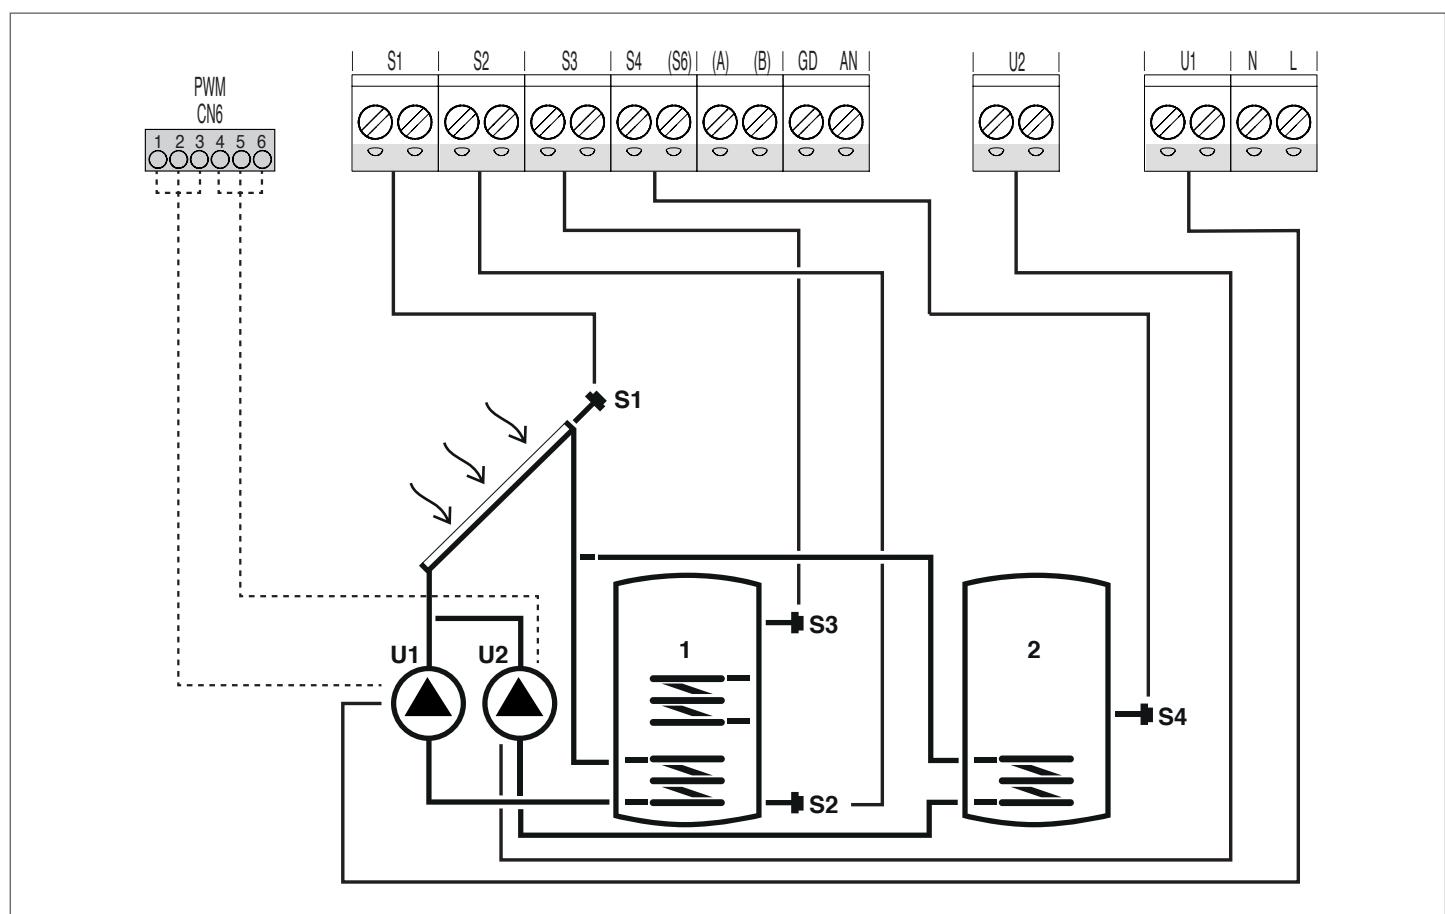

The system works on the temperature difference between solar collector (S1) and the low zone of the first storage system (S2) to maintain the storage 1 temperature set in parameter n°59 (B1LO – SETPOINT BOILER1 LOW). It also works on the temperature difference between solar collector (S1) and the low zone of the second storage system (S4) to maintain the storage 2 temperature set in parameter n°64 (B2LO – SETPOINT BOILER2 LOW).

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated. The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

If the difference S1-S4 is greater than or equal to the value set in parameter n°12 (ON14), the pump connected to output U2 is activated.

The pump (U2) remains active until the temperature difference between S1 and S4 reaches the value set in parameter n°13 (OF14). The system works with priority logic (alternating between the two storage zones) and it is possible to change the priority of the storage to be heated first with the parameter n°53 (PRBO) (by default the first storage zone has priority).

NOTE: as second pump (U2), it is recommended to use a pump with modulation PWM.

System 7 – SOLAR SYSTEM WITH 2 COLLECTORS AND 1 ACCUMULATION TANK

The system works both on the temperature difference between the first solar collector (S1) and the low zone of storage system (S2) as well as on the temperature difference between the second solar collector (S6) and the same zone (S2) to maintain the storage temperature set in parameter no. 59 (B1L0 – SETPOINT BOILER1 LOW).

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated. The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12). If the difference S6-S2 is greater than or equal to the value set in parameter n°14 (ON62), the pump connected to output U2 is activated.

The pump (U2) remains active until the temperature difference between S6 and S2 reaches the value set in parameter n°15(OF62).
NOTE: as second pump (U2), it is recommended to use a pump with modulation PWM.

System 8 – Solar system with supplementary heating through pump acting on solid fuel generator

The system works on the temperature difference between solar collector (S1) and the low zone of storage system (S2) to maintain the temperature set in parameter no. 59 (B1LO – SETPOINT BOILER1 LOW). It manages a supplementary system (2), for example a solid fuel generator, by working on the temperature difference between said system (S4) and the high zone of storage system (S3) to maintain the temperature set in parameter no. 56 (B1HI – SETPOINT BOILER1 HIGH).

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated. The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

If the difference S4-S3 is greater than or equal to the value set in parameter n°24 (ON43) and the temperature of solid fuel generator (S4) is greater than the value set in parameter n°160 (T10N), the pump connected to output U2 is activated.

The pump (U2) remains active until the difference S4-S3 reaches the value set in parameter n°24 (OF43) or if the temperature of solid fuel generator (S4) reaches the value set in parameter n°163 (T10F).

System 9 – SOLAR SYSTEM WITH TEMPERATURE INCREASE SYSTEM IN HEATING CIRCUIT RETURN

The system works on the temperature difference between solar collector (S1) and the low zone of storage system (S2) to maintain the storage temperature set in parameter no. 59 (B1L0 – SETPOINT BOILER1 LOW). It also checks the temperature difference between the high zone of storage system (S3) and the return circuit of heating system (S6) to integrate such system in case the storage system is sufficiently heated.

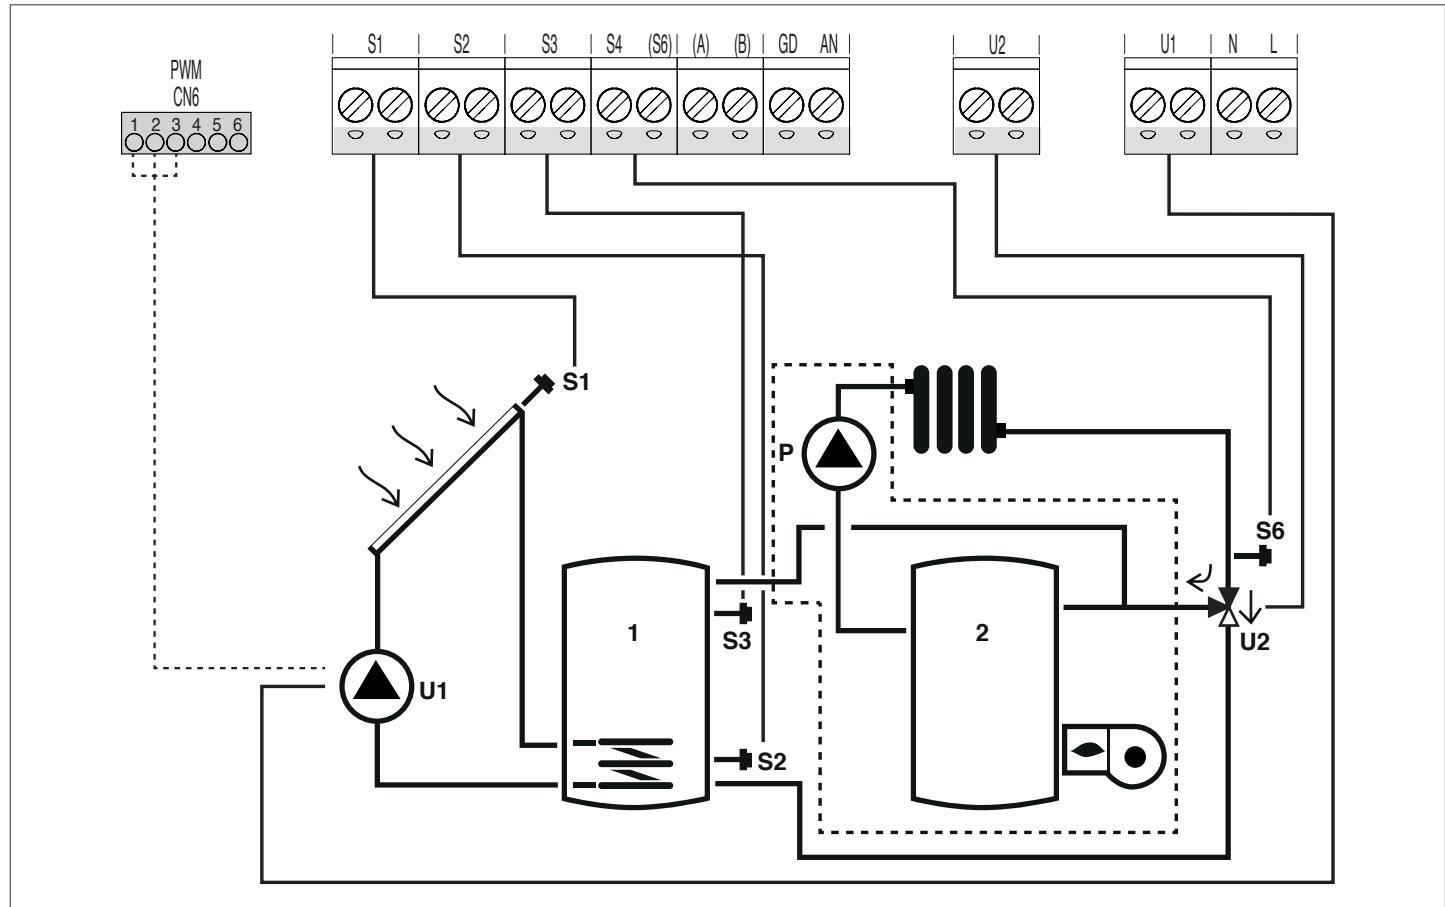

The supplementary increase system is used for the return circuit of the heating system.

If the difference S1-S2 is greater than or equal to the value set in parameter n°8 (ON12), the pump connected to output U1 is activated.

The pump (U1) remains active until the temperature difference between S1 and S2 reaches the value set in parameter n°9 (OF12).

If the difference S3-S6 is greater than or equal to the value set in parameter n°18 (ON36), the solenoid valve connected to output U2 is switched.

The heating circuit is heated until the difference S3-S6 reaches the value set in parameter n°19 (OF36).

Key:

SET editable parameter

/ parameter or value not utilised

R/O parameter available for modbus in read-only mode

R/W parameter available for modbus in write and read mode

S temperature probe

U pump/valve managed by regulator

P pump

--- heat generator

For operating instructions on how to modify adjustable parameters, refer to chapter "Parameter description".

Par. No.	Description	Initials	UM		Value				Register Index	Modbus address	USER / INST.
					min.	max.	default	step			
0	S1 probe S1 temperature display	S1	°C	VIS	-40	>260	/	0,1	1000[R/O]	1	U
1	S2 probe S2 temperature display	S2	°C	VIS	-40	>260	/	0,1	1001[R/O]	1	U
2	S3 probe S3 temperature display	S3	°C	VIS	-40	>260	/	0,1	1002[R/O]	1	U
5	S6 probe S6 temperature display	S6	°C	VIS	-40	>260	/	1	1005[R/O]	1	U
8	DTON S1S2 defines the S1-S2 differential for starting the pump associated to output U1	ON12	°C	SET	5	10	6	0,5	1008[R/W]	1	I

Par. No.	Description	Initials	UM		Value				Register Index	Modbus address	USER / INST.
					min.	max.	default	step			
9	DTOFF S1S2 defines the S1-S2 differential for stopping the pump associated to output U1	0F12	°C	SET	1	4	4	0,5	1009[R/W]	1	I
18	DTON S3S6 defines the S3-S6 differential for enabling the valve associated to output U2	0N36	°C	SET	5	10	6	0,5	1020[R/W]	1	I
19	DTON S3S6 defines the S3-S6 differential for disabling the valve associated to output U2	0F36	°C	SET	1	4	4	0,5	1021[R/W]	1	I
41	MANUAL MODE U1 enables/disables manual operation of output U1	MAN1	-	SET	OFF ON AUTO	OFF ON AUTO	AUTO	1	/	/	I
59	SETPPOINT B01 LOW ZONE defines the water temperature setpoint for the low zone of STORAGE SYSTEM 1	B1L0	°C	SET	15	90	60	0,5	1059[R/W]	1	U
76	THRESHOLD FOR U1 SOLAR PUMP ACTIVATION defines the temperature threshold at which heat exchange between solar panel and storage system is permitted	PS10	°C	SET	10	30	10	0,5	1076[R/W]	1	I
82	SYSTEM NUMBER defines the system number to be used	SYSN	-	SET	1	9	1	1	1082[R/W]	1	I
112	ACTUAL SPEED U1 displays the current speed of the pump connected to output U1	U1 %	%	VIS	0	100	/	1	1112[R/O]	1	I
115	ACTUAL SPEED U2 displays the current speed of the pump connected to output U2	U2 %	%	VIS	0	100	/	1	1115[R/O]	1	I
124	MINIMAL SPEED U1 defines the minimum speed of the modulating pump associated to output U1	U1 %	%	SET	10	90	30		1124[R/W]	1	I
136	U1 OUTPUT CONTROL MODE defines the control type of output U1: ON-OFF; IMPU= cut-off; MODU= PWM	PIU1	-	SET	ON-OFF IMPU MODU	ON-OFF IMPU MODU	MODU	1	/	/	I
147	Pump modulation defines the modulating pump regulation type to maintain the set setpoint (OFF = linear regulation; ON = PID regulation).	ALTM	-	SET	OFF	ON	ON	1	/	/	I
148	U1 MODULATION DIFFERENTIAL SET defines the temperature differential (S1-S2) associated with output U1, regulated according to the function defined by the parameter PUMP MODULATION	SOU1	°C	SET	ON12	30	20	0,5	1148[R/W]	1	I
166	SOLAR PANEL 1 ANTI-STAGNATION FUNCTION START TEMPERATURE defines the temperature threshold at which the anti-stagnation function relating to the solar collector controlled by probe S1 is activated	OSP1	°C	SET	100	120	120	0,5	1166[R/W]	1	I
169	SOLAR PANEL 1 ANTISHOCK FUNCTION START TEMPERATURE defines the temperature threshold at which the pump switches from continuous operation to intermittent operation (antishock)	OPP1	°C	SET	125	200	140	0,5	1169[R/W]	1	I

Par. No.	Description	Initials	UM		Value				Register Index	Modbus address	USER / INST.
					min.	max.	default	step			
178	BO1 SAFETY MAXIMUM TEMPERATURE defines the temperature threshold at which any anti-stagnation or heat exchange function relating to storage system 1 must stop	B1ST	°C	SET	70	90	85	0,5	1178[R/W]	1	I
182	THERMAL ANTISHOCK FUNCTION ENABLE enables the anti-thermal shock function to protect the solar collectors	ASCK	-	SET	OFF	ON	ON	1	/	/	I
183	ANTISHOCK FUNCTION STOP THRESHOLD defines the temperature threshold below which the pump returns to continuous operation (antishock operation stop)	ASST	°C	SET	115	125	120	1	1183[R/W]	1	I
184	Pump ON interval during anti-thermal shock function defines the pump operating interval during antishock	TS0N	sec	SET	1	120	3	1	/	/	I
185	Pump OFF interval during anti-thermal shock function defines the pump deactivation interval during antishock	TSOF	sec	SET	30	1800	60	1	/	/	I
186	ANTISHOCK FUNCTION PUMP SPEED	ASPE	%	SET	10	100	100	1	/	/	I
190	ANTIFREEZE ENABLE activates the anti-freeze function to protect solar panel no.1	APS1	-	SET	OFF	ON	ON	1	/	/	I
199	OPERATING HOURS OUTPUT U1 Stores/resets the operating hours of the pump connected to output U1	P1TI	h	VIS	0	9999	/	1	1196[R/W]	1	I
208	BO1 NIGHT COOLING FUNCTION activates the night cooling function of integration system 1	NCB1	-	SET	OFF	ON	ON	1	/	/	I
247	RESET DEFAULT PARAMETERS set the parameter to 1 to restart the control unit and restore the default parameters	RSTD	-	SET	0	1	0	1	/	/	I
250	MODBUS SLAVE ADDRESS defines the address of the solar regulator configured as Slave in a MODBUS RTU network	ADMB	-	SET	1	32	1	1	/	/	I

6 TROUBLESHOOTING

FAULT	CAUSE	SOLUTION
The control unit does not turn on.	Lack of power supply.	<ul style="list-style-type: none"> - Check the power cable. - Check electric power supply. - Check the status of the regulator fuse.
The temperature of probe Sx is not displayed (x = 1, 2, 3, 4, 6).	<p>Cable of sensor Sx not connected to the control unit.</p> <p>Probe Sx faulty.</p>	<ul style="list-style-type: none"> - Check connection between probe Sx and control unit. - Replace probe Sx.
The symbol  flashes Pump P1 is stopped and output U1 turned off	Probe S1, positioned on solar collector no.1, not correctly installed or faulty. Probe S2, positioned in the low zone of the storage system, not correctly installed or faulty.	<ul style="list-style-type: none"> - Replace the probe. - Check the proper positioning of the probe and the wiring/connection integrity.
The symbol  flashes Parameter LOW BOILER1 SETPOINT B1L0 is limited to 50°C	Probe S3, positioned in the high zone of the storage system, faulty.	<ul style="list-style-type: none"> - Replace the probe.
The symbol  flashes Pump P3 is stopped and output U2 turned off in systems 2 and 8	Probe S4, positioned on the second storage system, faulty.	<ul style="list-style-type: none"> - Replace the probe.
The symbol  flashes Output U2 is turned off in system 5	Probe S4, positioned on the second storage system, faulty.	<ul style="list-style-type: none"> - Replace the probe.
The symbol  flashes Pump P2 is stopped and output U2 turned off in system 6	Probe S4, positioned on the second storage system, faulty.	<ul style="list-style-type: none"> - Replace the probe.
The symbol  flashes Pump P4 is stopped and output U2 turned off in system 7	Probe S6, positioned on solar collector no.2, faulty.	<ul style="list-style-type: none"> - Replace the probe.
The symbol  flashes Output U2 is turned off in system 9	Probe S6, positioned on return circuit of heating system, faulty.	<ul style="list-style-type: none"> - Replace the probe.

FAULT	CAUSE	SOLUTION
Pressure of Grundfos sensor is not displayed.	Cable of sensor not connected to the control unit.	- Check connection between sensor and control unit.
	Sensor faulty.	- Replace the sensor.
Temperature of Grundfos sensor is not displayed.	Cable of sensor not connected to the control unit.	- Check connection between sensor and control unit.
	Sensor faulty.	- Replace the sensor.
Flow rate of Grundfos sensor is not displayed.	Cable of sensor not connected to the control unit.	- Check connection between sensor and control unit.
	Sensor faulty.	- Replace the sensor.
Anti-thermal shock function is not performed.	Anti-thermal shock function disabled.	- Enable anti-thermal shock function through the menu.
Anti-freeze function is not performed.	Anti-freeze function disabled.	- Enable anti-freeze function through the menu.
Thermal disinfection function is not performed (available for systems 1, 3, 8 only).	Thermal disinfection function disabled.	- Enable thermal disinfection function through the menu.
Night cooling function is not performed.	Night cooling function disabled.	- Enable night cooling function through the menu.

7 RECYCLING AND DISPOSAL

The solar controller includes the ABS casing and the electronic board. At the end of the device's useful life, these components must be separated and disposed of according to current regulations in the country of installation.

The manufacturer strives to continuously improve all products. Appearance, dimensions, technical specifications, standard equipment and accessories are therefore liable to modification without notice.
