

NXHM 004-016

Monobloc air-water heat pumps

Reversible air-water "quiet operation" heat pump with helicoidal fans 4 kW - 16 kW, with R32 ecological refrigerant

NXHM 004-016

PRODUCT DESCRIPTION

NXHM is a high-efficiency residential hydronic heat pump for heating and cooling, with the possibility of domestic hot water production for domestic use.

The unit works with R32 ecological refrigerant, guaranteeing not only low global warming potential (GWP) and low CO₂ emissions, but also optimum energy efficiency over the whole operating range.

NXHM is also fitted with new exchange coils with the special hydrophilic and anti-corrosion Blue-Fin treatment that improves the drainage of condensate on the fins, thereby reducing the risk of the coils freezing (maximum efficiency even in damp climates).

NXHM comes in 10 different models with a heating capacity from 4.2 to 15.9 kW.

- Twin rotary compressor with DC inverter technology, that modulates the output to adapt perfectly to the real load needed.
- High COP and EER values (all the NXHM heat pumps comply with the highest standards requested in terms of energy efficiency).
- Performance ratings certified by the third party body HP Keymark.
- They can be connected to low-temperature radiators, radiant floor elements and fan coil type units.
- Water heating temperature up to +65°C.
- Easy, quick installation.
- Low unit noise level.
- Wired control panel included, for the complete management of a heating/cooling/DHW system.
- The control panel can manage up to 6 units (even of different output levels) in cascade format - 1 master and 5 slaves.
- Anti-freeze protection as standard, to protect the entire system - in particular the hydraulic parts - from the potential damage caused by freezing.

The performance values comply with Standards UNI EN 14511:2018 and UNI EN 14825:2016. Performance data certified by HP Keymark.

(1) Input power from compressors and from fans and circulator in the maximum operating conditions, with the nominal power supply voltage.

(2) Maximum unit operating current with the nominal power supply voltage.

(3) Sound emission values declared, in accordance with standard EN 12102-1.

(4) Measured in a semi-anechoic chamber, at a distance of 1m from the front of the unit and a height from the floor equal to (1+H)/2, where H is the height of the unit expressed in metres (in accordance with standard EN 12102-1).

 The data in the grey boxes are to be used for the telematic mailing to ENEA for tax relief purposes.

 The data in the grey boxes are to be used for the registration of the control box in the F-GAS databank.

OPERATING LIMITS NXHM

COOLING MODE

TA Outside air temperature.
TW Water delivery temperature.

Operating range with heat pump, with possible limits and protection.

HEATING MODE

TA Outside air temperature.
TW Water delivery temperature.

Operating range with heat pump, with possible limits and protection.
The heat pump switches off and only the external heat source is active.

If the external heat source setting is enabled, that is the only heat source active.
If the external heat source setting is disabled, only the heat pump is active. Cases of limits and protection may arise while the heat pump is operating.
Maximum temperature line for the inlet water with heat pump operation.

DHW MODE

TA Outside air temperature.
TW Water delivery temperature.

Operating range with heat pump, with possible limits and protection.
The heat pump switches off and only the external heat source is active.

If the external heat source setting is enabled, that is the only heat source active.
If the external heat source setting is disabled, only the heat pump is active. Cases of limits and protection may arise while the heat pump is operating.
Maximum temperature line for the inlet water with heat pump operation.

SOUND PRESSURE LEVEL

Model	UM	NXHM									
		004	006	008	010	012	014	016	012T	014T	016T
Sound pressure (1)	dB (2)	45	47,5	48,5	50,5	53	53,5	57,5	53,5	54	58

- (1) The sound pressure level is measured at a position 1 m in front of the unit and $(1+H)/2$ m (where H is the height of the unit) above the floor in a semi-anechoic chamber. During on-site operation, sound pressure levels may be higher due to ambient noise.
- (2) dB is the maximum value tested under the following conditions:
 Outdoor air temperature 7°C DB, 85% R.H.; EWT 30°C, LWT 35°C. Variable compressor frequency.
 Outdoor air temperature 7°C DB, 85% R.H.; EWT 47°C, LWT 55°C. Variable compressor frequency.

Unit of measurement: mm.

PLACE OF INSTALLATION

The unit is equipped with flammable refrigerant and must be installed outdoors in a well-ventilated place. Make sure that appropriate measures are taken to prevent the unit from being used as a shelter by small animals.

Choose an installation site that meets the following conditions:

- Well-ventilated.
- In an area which will not disturb any neighbours.
- On a level surface able to support the weight of the unit as well as any vibrations.
- In an area allowing maintenance to be carried out.

When installing the unit in a location exposed to strong wind, pay special attention to the following.

Strong winds of 5 m/sec or more blowing against the air outlet of the unit may cause a short circuit (exhaust air intake), which could have the following consequences:

- Deterioration of operational capacity.
- Frequent frost acceleration when operating in heating mode.
- Interruption of operation due to increased high pressure.
- When a strong wind blows continuously on the front of the unit, the fan can start to rotate quickly causing it to break.

When using the unit in cold climates, observe the instructions provided below:

- Never install the unit in a place where the intake side can be directly exposed to the wind.
- In areas with heavy snowfall, it is extremely important to choose an installation site where snow will not affect the device. If it is possible for snow to fall from the side, make sure that the heat exchanger coil is not affected by snow (if necessary, build a canopy).
- Install the unit high enough to prevent it from being buried in snow.

In normal conditions

	A

HYDRAULIC MODULE

NXHM 004-006

NXHM 008-016

Assembly unit		Explanation
1	Automatic air purge valve	Remaining air in the water circuit will be automatically removed from the water circuit.
3	Expansion vessel	Balances water system pressure.
4	Refrigerant gas pipe	/
5	Temperature sensor	Four temperature sensors determine the water and refrigerant temperature at various points in the water circuit. 5.1-T2B; 5.2-T2; 5.3-T1(optional); 5.4-TW_out; 5.5-TW_in
6	Refrigerant liquid pipe	/
7	Flow switch	Detects water flow rate to protect compressor and water pump in the event of insufficient water flow.
8	Pump	Circulates water in the water circuit.
9	Plate heat exchanger	Transfer heat from the refrigerant to the water.
10	Water outlet pipe	/
11	Pressure relief valve	Prevents excessive water pressure by opening at 3 bar and discharging water from the water circuit.
12	Water inlet pipe	/

WATER IN THE HEATING SYSTEMS

CHEMICAL-PHYSICAL CHARACTERISTICS

The chemical-physical characteristics of the water must comply with European standard EN 14868 and the tables below:

System water reference values		
pH	-	7 - 8
Electrical conductivity	µS/cm	10 - 600
Chlorine ions	mg/l	< 10
Sulphuric acid ions	mg/l	< 30
Total iron	mg/l	< 5
Alkalinity M	mg/l	< 100
Total hardness	mmol/l	1 - 2.5
Sulphur ions	-	none
Ammonia ions	-	none
Silicon ions	mg/l	< 1

Well or groundwater not coming from the aqueduct should always be carefully analysed and if necessary conditioned with appropriate treatment systems.

If the initial water hardness exceeds the value indicated in the table, a water softening system must be used.

Excessive water softening (total hardness < 1.5 mmol/l) could lead to corrosion on contact with metal elements (pipes or boiler parts). The conductivity value must also be kept within 600 µS/cm.

Check the chloride concentration at the outlet after regeneration of the resins.

It is strictly prohibited to introduce acids into the washing circuit.

It is strictly prohibited to constantly or frequently top up the system, as this can damage the heat exchanger of the appliance.

SYSTEM WATER CONTENT AND FLOW RATE

Heat pumps require systems that guarantee a constant fluid flow rate to the device, within minimum and maximum values and with sufficient volumes to avoid any imbalance in the cooling circuits and ensure the correct degree of comfort.

SYSTEM WATER CONTENT

A minimum volume of water in the system's primary circuit must be guaranteed for the appliance to operate correctly.

The minimum volume is necessary to prevent the risk of ice formation during defrosting operations or continuous modulation of the compressor frequency.

It also provides the following advantages:

- less appliance wear;
- increase in system efficiency;
- improved stability and temperature precision.

The water flow rate must be kept constant during operation, and must respect the limits shown in the table:

Model	UM	NXHM									
		004	006	008	010	012	014	016	012T	014T	016T
Minimum system water content (1) (2)	l	25	25	25	25	40	40	40	40	40	40
Minimum water flow rate	m³/h	0.40	0.40	0.40	0.40	0.70	0.70	0.70	0.70	0.70	0.70
Maximum water flow rate	m³/h	0.90	1.25	1.65	2.10	2.50	2.75	3.00	2.50	2.75	3.00

(1) Excluding the volume of water inside the unit.

(2) In the case of cascade installation, the minimum volume should be $\geq 40 \text{ l} \cdot n$ where n is the number of connected units.

HEAT PUMPS

Air-water heat pumps

ELECTRICAL WIRING

SAFETY DEVICE REQUISITES:

- Select the cable diameters (minimum value) individually for each unit on the basis of tables 1 and 2, where the nominal current in table 1 means MCA in table 2. If the MCA is higher than 63A, the wire diameters must be selected in accordance with the national wiring regulations.
- The maximum permitted variation between the phases in the voltage field is 2%.
- Select the circuit breaker that separates the contacts by at least 3mm on all the poles and allows for complete disconnection, where the MFA is used to select the current circuit breakers and the residual current circuit breakers.

SIZING THE CABLES

For the sizing of the electricity supply cable and the safety appliances, refer to the tables below:

Table 1

Nominal current of the appliance: (A)	Nominal cross section area (mm ²)	
	Flexible cables	Fixed wiring cable
≤3	0.5 and 0.75	1 and 2.5
>3 and ≤6	0.75 and 1	1 and 2.5
>6 and ≤10	1 and 1.5	1 and 2.5
>10 and ≤16	1.5 and 2.5	1.5 and 4
>16 and ≤25	2.5 and 4	2.5 and 6
>25 and ≤32	4 and 6	4 and 10
>32 and ≤50	6 and 10	6 and 16
>50 and ≤63	10 and 16	10 and 25

Table 2 Standard 4–16 kW single-phase and standard 12–16 kW three-phase

System	Outdoor unit				Supply current			Compressor		OFM	
	Voltage (V)	Hz	Min. (V)	Max. (V)	MCA (A)	TOCA (A)	MFA (A)	MSC (A)	RLA (A)	kW	FLA (A)

The port supplies the load with the control signal.

Two types of control signal port:

Type 1: Input of the clean contact type.

Type 2: The port supplies the signal with a 220V voltage. If the load current is <0.2 A, the load can be connected directly to the port. If the load current is ≥0.2A, the AC contactor must be connected for the load.

CONTROL PANEL

The control panel is the interface for the installer and the user to carry out all operations to set the operating parameters and display the status of the components in the device.

Depending on the temperatures detected by the probes in the appliance and any probes installed in the domestic hot water tank, in the room and externally, the electronics modulate appliance operation, and the operating condition can be shown in the display.

Use the panel to set the required temperature for the system and for domestic hot water.

NXHM can be controlled via:

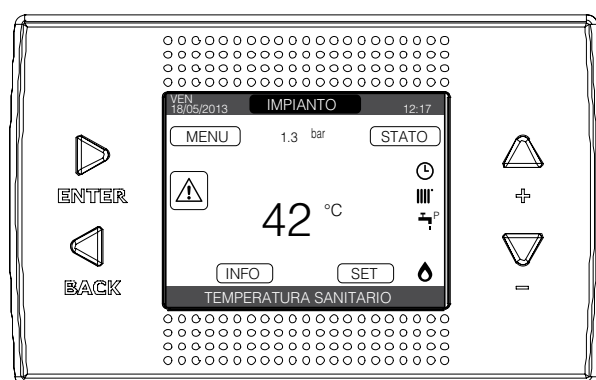

- Control panel
- REC10MH control panel
- External consents
- Modbus RTU

Control panel

Key	Description
MENU	Go to the menu structure (on the home page)

OK	Go to the next step when setting a programming in the menu structure; confirm a selection to access a submenu in the menu structure

REC10MH user interface

The user interface of the unit, also called "REC10MH interface", is installed at a distance.

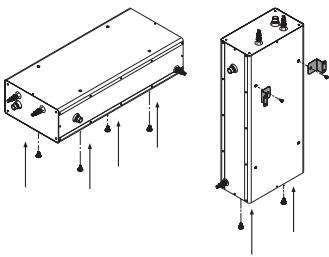

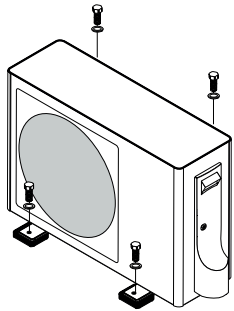

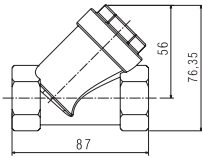

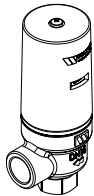

It's an extremely simple, user-friendly interface designed to enable the user to set the system operating temperatures for heating and air conditioning and the inertial DHW tank.

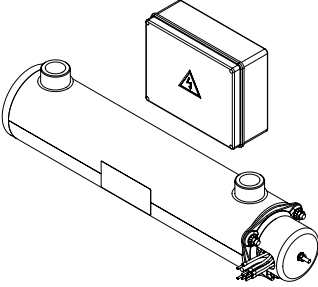

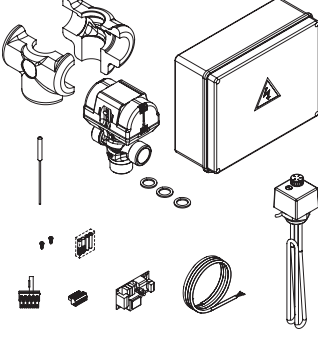

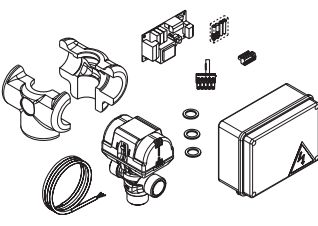

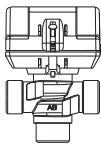

Refer to the specific manual for all the details about using this control.

	Description	004	006	008	010	012	014	016
DISTRIBUTION MODULES WITH SEPARATOR								
	<p>BAG3 HYBRID 1D: pre-assembled hydraulic distribution system for 1 direct zone, consisting of a vertical hydraulic flexible spacer, a twin coupling for 2 separate generators (boiler and heat pump), 1 high-head circulator, 1 flow sensor, 1 low temperature limit thermostat, and a pre-wired electronic ModBus board.</p> <p>The kit includes closed cell insulation which is ideal for use in cooling mode as well, to prevent the formation of condensate. The zone can be set with the following operating modes:</p> <ul style="list-style-type: none"> - heating only - cooling only - heating and cooling. <p>This product code relates to the internal components only; Bag3 Hybrid must be completed with the "flush-mounting box".</p>	•	•	•	•	•	•	•
	<p>BAG3 HYBRID 2D: pre-assembled hydraulic distribution system for 2 direct zones, consisting of a vertical hydraulic flexible spacer, a twin coupling for 2 separate generators (boiler and heat pump), 2 high-head circulators, 2 flow sensors, 2 low temperature limit thermostats, and 2 pre-wired electronic ModBus boards.</p> <p>The kit includes closed cell insulation which is ideal for use in cooling mode as well, to prevent the formation of condensate. The zones are all independent of each other, and can be set with the following operating modes:</p> <ul style="list-style-type: none"> - heating only - cooling only - heating and cooling. <p>This product code relates to the internal components only; Bag3 Hybrid must be completed with the "flush-mounting box".</p>	•	•	•	•	•	•	•
	<p>BAG3 HYBRID 1D+1M: pre-assembled hydraulic distribution system for 1 direct zone and 1 mixing zone, consisting of a vertical hydraulic flexible spacer, a twin coupling for 2 separate generators (boiler and heat pump), 2 high-head circulators, 1 motorised mixing valve, 2 flow sensors, 2 low temperature limit thermostats, and 2 pre-wired electronic ModBus boards.</p> <p>The kit includes closed cell insulation which is ideal for use in cooling mode as well, to prevent the formation of condensate. The zones are all independent of each other, and can be set with the following operating modes:</p> <ul style="list-style-type: none"> - heating only - cooling only - heating and cooling. <p>This product code relates to the internal components only; Bag3 Hybrid must be completed with the "flush-mounting box".</p>	•	•	•	•	•	•	•

	Description	004	006	008	010	012	014	016
	<p>Flush-mounting box: galvanised sheet metal box (400 x 797 x 160 mm) containing all the brackets needed to sustain the components (hydraulic and electric) of Bag3 Hybrid.</p> <p>The box has a lockable door (the key is supplied as standard), and can be installed in “flush-mounting” or “suspended” mode.</p>	•	•	•	•	•	•	•

	Description	1D	2D	1D + 1M
HYBRID DISTRIBUTION MODULE ACCESSORIES				
	<p>Diverting valve for BAG3 Hybrid: this kit provides a diverting valve for filling a DHW storage cylinder directly from the Bag3 Hybrid, exploiting the circulator of the main direct zone. It also contains an electronic control board with the “photovoltaic” function (that can be activated according to the generator pump model used).</p> <p>The kit contains:</p> <ul style="list-style-type: none">- 3-way diverting valve- couplings and insulation- electronic control board (to be installed in an electric box inside Bag3 Hybrid)- storage cylinder probe- connectors and wiring.	•	•	•
	<p>Board for photovoltaic system input: this kit allows the system to receive a signal (clean contact) from the photovoltaic panel, using it to define the operating priorities of the heat sources.</p> <p>The board is supplied complete with wiring (electrical supply and BUS connection), and must be installed in an electric box (not supplied).</p>	•	•	•
	<p>Taps for BAG3 Hybrid: 6 butterfly taps for shutting off the system side and heat pump side.</p> <p>This kit comes complete with 6 metres of adhesive insulation for avoiding heat loss and the formation of condensate.</p>	•	•	•

HEAT PUMPS

Air-water heat pumps

	Description	004	006	008	010	012	014	016
SOLAR THERMAL ACCESSORIES								
	<p>RSS R solar hydraulic unit: this kit is used to fully manage small solar systems. It must be purchased together with the solar interface kit.</p> <p>The kit contains:</p> <ul style="list-style-type: none"> - solar station - circulator cover with logo - connectors and wiring. 	•	•	•	•	•	•	•
	<p>Solar thermal interface board: this kit uses REC10MH system intelligence to manage the solar hydraulic unit (code 20116168).</p> <p>The kit consists of:</p> <ul style="list-style-type: none"> - 1 electronic control board in an electric box - 2 probes (1 solar probe and 1 DHW storage cylinder probe) - 1 support bracket with fixing elements. 	•	•	•	•	•	•	•
CONTROL PANELS								
	<p>REC10MH remote control panel for an additional zone or hybrid system management: complete with a header for wall installation, and a power supply unit (to be installed in an electric box) for monitoring the entire system connected to it - e.g. the generators (settings and alarms, depending on the generator model used) and the temperatures and time bands of the controlled zone. It is a compulsory accessory in full-electric systems.</p> <p>The panel interfaces via ModBus with the boilers and heat pumps, with Bag3 Hybrid, and with the control boards of the direct or mixing zone.</p>	•	•	•	•	•	•	•

NXHM 004-016

PRODUCT DESCRIPTION FOR SPECIFICATIONS

Outdoor monobloc air-water heat pump, single-phase and three-phase, with DC-inverter control and MITSUBISHI twin rotary compressor for all sizes to guarantee optimum dynamic balancing and reduce vibration, with continuous modulation from approx. 40% to 120%, designed to work with R32 refrigerant gas.

Given the wide operating range, it's ideal for every type of system, whether hybrid or monovalent. In heating mode in fact, it can supply water at 60°C with an outdoor temperature as low as -15°C, and in cooling mode water at 7°C with an outdoor temperature up to 43°C, and can also produce domestic hot water thanks to storage tanks and fixed coils or heat exchangers for instantaneous DHW production, as it can supply delivery water at 55°C with a temperature of 43°C outside.

Top level performance. Up to A+++ for low temperatures and A++ for medium temperatures in temperate zones, according to EN 14825_2016. All the performance values are certified by HP Keymark, MCS.

Built in accordance with the European eco-design regulations, that define the requisites for the ERP (Energy Related Products) standard in order to improve energy efficiency.

CHARACTERISTICS

- NXHM provides an extremely high level of energy efficiency in both heating and cooling mode, thereby guaranteeing significant energy savings. The large, high-efficiency coils, together with the optimised circuits, ensure results that meet the European tax relief requisites. Efficiency levels in partial load conditions (seasonal energy efficiency) are the highest in this industrial sector.
- Comfort throughout the year: the ground-breaking technology employed for NXHM means boosted comfort levels for users in terms of both water temperature control and quiet operation. The required temperature is reached quickly and kept constant, without any fluctuations. NXHM offers optimised, personalised comfort levels both in winter and in summer.
- NXHM can work in cooling mode even with low outdoor temperatures (from -25°C, and up to 43°C). To ensure the maximum comfort for the user, the units work in heating mode with outdoor temperatures down to -25°C, whereas in summer they can produce hot water up to 50°C for DHW applications, with the outdoor temperature as high as 43°C.
- In the ambient comfort modes (both heating and cooling), weekly programming is a standard feature.
- In the DHW modes, weekly programming and an anti-legionella function - with thermal disinfection - are available as standard.
- A multitude of possible system layouts. Thanks to the sensors available as accessories, the unit can manage - for example - a solar system, one or two zones (one of them mixed) and DHW recirculation.
- The possibility to link up to 6 units in a cascade. In cascade configurations, the master unit can be dedicated to DHW production.
- USB port available for updating the technical board software.
- A clean input is available, dedicated to smart grid functions.
- Operation guaranteed with at least 40lt of water in the system.

UNIT COMPONENTS

- **STRUCTURE:**
Cabinet made of sheet steel painted with neutral-coloured powders (RAL 7035) to enhance resistance to corrosion caused by atmospheric agents. All the panels are removable.
- **COMPRESSOR:**
The compressor has a double protective sound insulation shield to further reduce the noise levels.
Advanced technology ensuring optimum energy efficiency and characterised by high output levels in peak conditions and optimised efficiency at low and medium compressor speeds.
The NXHM heat pump uses DC inverter technology that combines two electronic adjustment logics, pulse amplitude modulation (PAM) and pulse width modulation (PWM), to guarantee optimised compressor operation in all working conditions, minimise temperature fluctuation and ensure perfect comfort adjustment whilst at the same time considerably reducing energy consumption.
 - PAM: the modulation of the direct current pulse amplitude commands the compressor to work in maximum load conditions (start-up and peak load) so as to increase the voltage in the case of a fixed frequency. The compressor works at high speed to quickly reach the required temperature.
 - PWM: the modulation of the direct current pulse width commands the compressor to work in partial load conditions, adapting the frequency in the case of a fixed voltage. The compressor speed is precisely adjusted and the system offers a high comfort level (no temperature fluctuations) in working conditions of outstanding efficiency.
 The compressor frequency increases constantly until it reaches the maximum level. This ensures that there are no intensity peaks during the start-up phase, and also means a secure connection to the single-phase current supply even for high-output systems. This compressor start logic makes "soft start" starter devices unnecessary, at the same time guaranteeing that the maximum output is available immediately.
- **EXTERNAL COIL:**
The external coil is made of copper pipes and hydrophilic aluminium fins. This solution makes it easier for the water to move towards the bottom of the heat exchanger, by means of gravity.
In particular, this innovation means:
 - frost takes longer to form, so it doesn't build up so much on the coil;
 - the defrosting phase is more efficient thanks to improved water runoff on the fins (and this boosts operation in heating mode).
 Blue Coating treatment is applied as standard to improve the resistance of the coils to corrosive agents, and is recommended in all applications where there is a moderate risk of corrosion.
- **EXTERNAL FAN:**
Single DC brushless fan motor with variable speed for optimum air distribution and extremely low noise levels. The possibility to set two different maximum noise levels.

HEAT PUMPS

Air-water heat pumps

- **ELECTRONIC EXPANSION VALVE:**

The electronic expansion valve is a dual flow electronic expansion device whose job is to optimise the volume of the refrigerant fluid in the circuit and therefore the overheating issue, preventing the fluid from returning to the compressor. This device further boosts the high efficiency and reliability of the system as it enables it to work even with very low condensation pressure values across the whole operating range.

- **SOLENOID VALVE:**

Given the wide operating range of the unit, the solenoid valve (fully managed by the unit itself) allows the compressor to work at optimum temperature levels at all times.

- **PLATE HEAT EXCHANGER:**

Vertical plate heat exchanger in AISI 316 stainless steel.

- **BUILT-IN HYDRONIC UNIT:**

The hydronic module is always installed. It's supplied with a variable speed circulation pump, a flow switch, a 3 bar safety valve, an expansion tank and water temperature probes (inlet and outlet). A backup electric heater is available as an accessory. In domestic applications, there is the possibility to connect the inertial storage tank directly underneath the unit to minimise the space taken up.

All the internal hydronic parts are insulated to reduce heat loss. The anti-freeze program contains special functions that use the heat pump and backup heater (if installed) to protect the entire system from the risk of freezing. When the water flow temperature in the system falls to a certain value, the unit heats the water using both the heat pump and the electric heating tap (and also the backup heater, if installed). The anti-freeze protection function is only deactivated when the temperature rises to a certain value.

This image shows a full page of white paper with horizontal dotted lines. The lines are evenly spaced and run across the width of the page, providing a guide for handwriting or typing. There are no margins, text, or other markings on the page.
